12,192. (*Chairman.*) Where the specific ratio is a matter of expediency, do you think there is any objection to fixing a rupee, say, at 1*s.* 4*d.*, or do you prefer a higher or lower ratio?—That is my sixth point. I think 1*s.* 4*d.* is the best rate, simply because that is the present rate, and to make it higher or lower would be to make an unnecessary change.

12,193. What do you say to the objections of Indian exporters, either to a stable ratio or to this particular ratio of 1*s.* 4*d.*?—That is the seventh point on which I wish to express a decided opinion. I think there is nothing whatever in that objection. I think they have no right to make that objection.

12,194. Why?—For two reasons. I think that they make a mistake about their own interests in the matter. They talk about a low ratio. But a low ratio, if fixed and steady, would make no difference to them. What they want is a falling ratio. They have an idea that a falling ratio gives them an advantage. I am inclined to think that in the long run it does not give them an advantage. I am inclined to think that on the whole it is the best for exporters, as for everybody else, to have a stable standard of value with their customers, and that it is not an advantage to them that the money in which they are paying their labourers should tend to vary as against money which they receive for their produce. I think on the whole it is to their advantage that the ratio should be a stable one. When you come to particulars, one of the things they complain of is their competition with silver-using countries. China especially is one that is mentioned. My impression is that, if you were to compare the effect of currency with a stable ratio upon trade with the effect of such an imperfect currency as that of China, (which is after all, I fancy, rather a copper currency than a silver currency), you would find that the Indian exporter has an advantage over the China exporter even in the matter of currency. Then, again, adjustments of prices and wages sooner or later take place. If they take place at once, then the exporter gets no advantage at all. There is one case in which he gets an advantage; that is the case in which the adjustment of his wages and expenses does not take place at once, and in which consequently he is receiving the price of his produce in gold, and has to pay wages in a depreciating currency. There undoubtedly the exporter gets an advantage for the moment; it is an advantage which I do not think lasts, first, because an adjustment must sooner or later take place and the exporter's expenses must rise, and, secondly, because it does harm to the country, and he will feel that in the long run; but for the moment he gets an advantage. He gets that advantage, however, at the cost of the persons to whom he pays wages, or at the cost of somebody else in the country. It is therefore a transfer, it is not a gain, it is not a benefit. It is a transfer of benefit, of advantage, of gain from one person to another—from the Indian native to the English exporter—and I think that is an unjust advantage, and one that he ought not to have.

12,195. That is the case of the tea trade profit?—That is so. The tea trade is a special case in point. Unlike many other Indian investors, the English investor in the Indian tea trade receives the whole of his returns in the form of the gold price of tea in gold countries, whilst he pays all his outgoings in rupees. No wonder that he likes a state of things in which the gold price of the rupee is constantly falling.

12,196. You regard that really as an illegitimate profit and made at the expense of other interests?—Exactly.

12,197. In fact, what one gains somebody else must lose?—Certainly. There is no actual profit by a change in value between the sovereign and the rupee. What one person gains another must lose, and *vice versâ*.

There is one other observation I should like to make before quitting this point. It has been said by many persons, and said, as I think, with great exaggeration, that the benefit which the exporting merchant gets is to lower the price of the article that he sells in the gold country. I doubt if that is the case to any great extent. It may occasionally, in certain states of the market, have some effect of this kind. Where it has that effect it is clear that no one in the exporting country gets any gain; the exporting merchant does not get any advantage, because he is obliged to lower his gold price; the only person who gets an advantage is the consumer in the gold country. I do not say that this happens often; I do not think it does.

12,198. We have had conflicting evidence on that point. Take this concrete instance: a certain amount of tea is sold in the London market for a sovereign. At one time at an unstable ratio that sovereign commands 18 rupees; at another time that sovereign commands only 15 rupees. The wages are unaffected; they have to be paid in rupees; therefore there is a profit as between the 18 rupees and the 15 rupees, which goes into the pocket of the exporter of the tea?—It has been stated, and if I remember rightly, by Mr. Lindsay, among other persons, that under certain circumstances and in certain particular states of the market the profit which the exporter gets may induce or compel him to lower his gold price. I do not think that happens often.

12,199. Have you anything to say with reference to the limitation of the currency which has already taken place by the closing of the mints—as to whether that has any effect on the gold value of the rupee?—That is my eighth point. I am inclined to think that it has. The experience of last year shows that throughout both the slack time of the year and the busy time of the year the rupee has been maintained at 1*s.* 4*d.*

12,200. Do you think there is a contraction of the currency involved in the plan proposed by the Government of India?—That is my ninth point. Yes, as far as I can understand their plan, they propose to actually ladle out, if necessary, a part of the currency, and so contract it violently. I should be indisposed to do that, if we have not reached the point at which the rupee is permanent at 1*s.* 4*d.* I should be disposed to let the natural state of things and the growing demands of business and the ordinary waste of currency raise it to 1*s.* 4*d.*, but I have every hope that the 1*s.* 4*d.* has come to stay.

12,201. What have you to say about the convertibility of the token rupee—assuming that to be adopted—into gold?—That is my tenth point, and a most important point it is. I believe that the only sound ultimate foundation for a gold standard in India is the convertibility of the token rupee currency of India into gold, if not for all purposes, at any rate for the purpose of foreign exchange.

12,202. How do you think that the Indian Government should deal with that question? What do you think is their responsibility?—I think that the Indian Government cannot escape the responsibility of

Rt. Hon. Lord Farrer.

1 March 1899.

guaranteeing convertibility and of maintaining such a degree of credit and accumulating such a reserve as may be necessary in order to enable it to discharge such responsibility.

12,203. What are the dangers which might be reasonably apprehended from convertibility?—That is an eleventh point. The danger is apprehended to be this; I am not now stating my own opinion, but this is what is put forward. It is thought that there may come a time when by reason of war, of famine, or otherwise, India's productive powers may be diminished, and when she will have reduced power of exporting to pay her debt; a time when imports will exceed exports; when the real exchange will be against India; when the value of the rupee in terms of the pound sterling will be lowered, and when there will in consequence be a tendency to export gold. At such a time, it is said that any gold in the Indian currency is likely to be exported; and not only so, but that, when it is known that the Indian Government will give gold for rupees at 1*s.* 4*d.*, there will be a drain on the Indian Treasury by the offer not only of the rupees in circulation but of the vast quantity said to be hoarded. Such a rush for gold, it is said, no treasury could stand.

12,204. That is your statement of the objections?—Yes, as far as I understand them.

12,205. What is your answer to those objections?—I think it must be admitted that, wherever there is a large token currency of whatever description, (and under the proposed circumstances the bulk of the Indian currency would be a token currency), whether silver, as in India, or notes, as in France, or bank money, as in England, there may be cases in which it is difficult or impossible to redeem the token money in gold. Even the Bank of France has had to suspend cash payments; and the restrictions of the Bank Charter Act in England have had to be suspended. Extreme cases may always require drastic remedies or powerful cordials, and India would probably be no exception to the rule. But these exceptional cases are not made the basis of our currency systems. We look to the ordinary state of things. Looked at from this point of view, the case of India seems to be a specially favourable one, for the following reasons. She has a great and elastic power of producing saleable exports; she imports, on the balance, a large quantity of the precious metals, which she retains with great tenacity; and she recovers very quickly from great depression, as is seen from the history of the last few years.

12,206. Will you go to the question of hoarded rupees?—This is a twelfth point, on which, from want of knowledge of India, I speak with more hesitation; but, so far as I can judge, the hoards do not frighten me. I do not see why they should come out and be presented for payment in gold. Perhaps on this point some encouragement may be derived from what has happened during the last year. The value of the rupee has been equivalent, or nearly equivalent, to 1*s.* 4*d.*, the highest point to which under the existing system it can rise, so that persons holding hoarded rupees might, if so disposed, have exchanged them for gold at this high rate. At the same time there was no undertaking on the part of the Government that they would give gold in future for rupees at this rate, and one of the principal features of the case before the Committee has been the future uncertainty of the rupee. Consequently a state of things has existed in which there was every motive for bringing out hoarded rupees and converting them into gold. And yet nothing of the kind has happened. The people have preferred to keep their rupees. Why should it be different in future, especially when the Government has pledged itself to maintain the gold value of the rupee, and when people will know that their rupees will always be worth the 1*s.* 4*d.* in gold? I do not myself, as far as I can judge from the evidence, attach much importance to this danger of the hoarded rupee.

12,207. (*Sir F. Mowatt.*) But do you say that this last year any man taking rupees could claim to get gold for them?—Yes, as long as the rupee was actually at 1*s.* 4*d.*; he could not go to the Government and get it, but he could have bought the gold.

12,208. He could have bought in the market?—Yes.

12,209. (*Chairman.*) Is there any other consideration to be taken into account, in your opinion, as to India keeping her gold?—Yes. The next point on which I wish to express a decided opinion is a very important one. To the above considerations bearing on the ability of India to keep her gold, it should be added that India has an honest and a solvent Government which is not likely to outrun the constable, as has been the case with most, if not all, the nations which have failed to maintain a gold standard. But this consideration leads to a caution. The gold standard cannot be secured without some effort and some sacrifice. Some reserve will be necessary, though I doubt whether it need be a very large one. But, if the actual reserve is not very large, India's credit ought to be proportionately stronger and more secure. For these objects it seems to me to be absolutely necessary that, pending the establishment of the gold standard, the finances of India should be most cautiously administered. India cannot afford at the same moment to establish a gold standard; to indulge in costly wars and increased military expenditure; or to materially reduce taxation. Even Public Works, which may in the end be reproductive, might cause a dangerous strain, and, for the present, borrowing for this purpose of Public Works should, as far as possible, be either avoided or very cautiously conducted. To establish the standard of value, and to maintain the reserves or credit necessary for that purpose, should be the paramount object of the Indian Government.

12,210. Do you mean that the Indian Government should as soon as possible form an actual gold reserve?—That is a point which I will come to afterwards. But they must either form a gold reserve or be in a position of financial strength and credit in which they could at once procure the gold if it was necessary.

12,211. Let me put an analogous case. Suppose in this country we had a large surplus at the end of the financial year, which surplus would, in a normal state of things, be appropriated to the liquidation of debt. If a gold reserve was wanted for some financial experiment, would not the course be not to pay off debt and not to reduce taxation but to treat the two as a reserve for that future drain?—I think that might probably be the best way of doing what is needed.

12,212. And that would be sound policy as applied to India?—Yes, very probably; but at the same time it must be remembered that paying off debt increases the credit of India.

12,213. Of course that can be borrowed again?—Yes.

12,214. Assuming the normal average value of the rupee to be fixed at 1*s.* 4*d.*, and excluding any exceptional circumstances which might affect its value, and seasonal and other fluctuations which might make the sterling value of the rupee greater at one time than at another, how would the steadiness of the rate have to be provided for?—There must be a reserve of gold, or of silver, or of both, sufficient to meet the demands occasioned by these fluctuations, just as reserves are kept in the Bank of England to meet fluctuations in this country.

12,215. If these conditions were observed and the productive powers of India maintained by ordinary sound administration, what do you say as to the excess of exports?—That is my next point, and it is one on which I lay great stress. Having established your currency, on what you believe to be a sound footing, then, I say, leave the exports to take care of themselves. There is no greater fallacy than to suppose that you can improve the exchange or the credit of India by manipulating currency for the purpose of increasing exports.

12,216. Is stringency to be cured by depreciation?—That is my next point. I think not. It is not cured by depreciation in this country. No one would dream, because there was a stringency in the money market, of authorising the Bank of England to issue more notes, and in the same way I do not believe that stringency in the Indian money market is to be permanently relieved by enabling them to add depreciated silver to the currency.

12,217. Just let us apply that to a state of stringency in this country. The property is there, the capital is there, but there is a want of currency. The Bank of England is not allowed to issue bank-notes unless there is either gold bullion to meet those banknotes or the Government debt which is added to that figure. Then in those circumstances the Chancellor of the Exchequer suspends the Bank Charter Act, and then they are allowed to issue notes without gold. Does not that relieve the stringency of the money market?—That is so, in the extreme cases to which I have already referred as special and exceptional cases. But these are not the ordinary case, and everyone would wish those extreme and exceptional cases to be as few as possible. I do not see how, if you have a token currency, you can avoid the possibility of an extreme case, and then you must meet it as best you can.

12.218. Have you anything to say with regard to the present year?—Yes; this Committee was appointed and our attention was first directed to this subject last year, when the question of the stringency was very different from what it is at present. I think it is now only necessary to refer to the facts of the present year. Since last spring, time must have further contracted the currency, relatively to the demands upon it; the volume of trade is much larger than it was; exchange is above 1*s.* 4*d.*; and at the same time the discount rate is 7 per cent. as against 12 per cent. or 13 per cent. in 1898. I am inclined to think that, if the question had arisen in the present year, it is doubtful whether your Committee would have been appointed.

12,219. If the stringency in question were due to a want of currency, and such want was also due to an unwillingness to buy rupees at 1*s.* 4*d.*, in consequence of mistrust concerning the future gold value of the rupee, what is the true way to remove that evil?—To establish confidence in the future gold value of the rupee.

12,220. And that would be sufficient?—That would be sufficient.

12,221. Now, about the ultimate intention of the Government of India with reference to the standard. Assuming that the plan for a gold standard is approved, what do you say about ensuring public confidence?—This is the last point on which I wish to express a decided opinion, and it is a very important one. If the proposed plan for the gold standard is to succeed, public confidence must be assured; and for this purpose it is essential that this Committee, as well as the Indian and the English Governments, should, whatever may be the intermediate steps adopted, allow no doubt whatever to be entertained as to their intention ultimately to establish and maintain the gold value of the rupee at 1*s.* 4*d.*, or at whatever other ratio they may adopt. This, in my opinion, they can only do by making the token rupee convertible into gold. In what manner, by what stages, and under what limitations such convertibility should be effected, are comparatively matters of detail.

12,222. These are the points on which you hold, what we may call, final opinions?—Strong opinions. No opinions on such a subject as currency can be considered as absolutely final; because circumstances may change in some manner which we do not now foresee.

12,223. We should like to have your opinion on some of those points as to which you may not be quite so decided. First take the question whether there should be a gold currency in India, as proposed by the India Government, or only a gold standard, as proposed by Mr. Lindsay and Mr. Raphael?—On this point I wish to be neutral, and to state what appear to me to be the principal considerations on both sides of the question. That the bulk of the Indian currency must be a silver token currency there is no doubt; and, if there is to be a gold currency, it will probably be confined, at any rate for a considerable time, to a marginal currency of comparatively small amount, used chiefly for the purpose of foreign remittances. If such a currency could be established, it would have one great advantage. It would leave the working of the *real* exchange between India and Europe to be governed entirely by business relations, as in the ordinary case of exchange between two countries each of which has a gold currency. The fluctuations of exchange above and below the actual par in each country would be limited by the actual cost of procuring and remitting gold, and within these limits the fluctuations would operate to redress excesses of liability on either side and to adjust the balance of liquidation. The schemes of Mr. Lindsay and Mr. Raphael propose to attain the same object, but in a more artificial and therefore less satisfactory way.

12,224. But we should like to hear your opinion of Mr. Lindsay's scheme?—In some respects I should prefer the schemes for a gold standard proposed by Mr. Lindsay and Mr. Raphael to any schemes for a gold currency. The reasons are so well stated by Mr. Lindsay in his evidence (questions 3580 and following, and 4001) and by Sir W. Hely Hutchison in his evidence that I need not repeat them here. A further consideration, which was perhaps in the state of opinion in the City of more importance last year than it is now, is that Mr. Lindsay's scheme would disturb the English money market less than a scheme for a gold currency—that it would leave the money in London and would probably create less alarm here. It would use no gold except what was necessary for the purpose of the remittances.

12,225. For the balance here?—The balance here. It would also enable the matter to be entirely conducted, if it was thought right, by the Bank of England. In fact, the balance might form part of the Bank reserve. I think I should add to that that it seemed exactly to hit the object that was wanted, namely, to provide for foreign remittances; and that therefore there was a great deal to be said for it on that ground. And, at the same time, you do not want a gold currency in India except for purpose of remittances.

12,226. Now, you have some detailed criticism to make of Mr. Lindsay's scheme?—Yes, but I should like first to add, in favour of Mr. Lindsay's scheme, that, whilst the existence of a gold currency in India would relieve the Government from the necessity of artificially fixing a margin, it would not relieve them from the necessity of interfering if the gold currency should tend to diminish and disappear and of determining the point in the falling value of the rupee which calls for such interference.

12,227. Assuming that Mr. Lindsay's scheme is adopted, what ought in your opinion to be the margin on either side of the par value beyond which the public would have a right to call on the Government for rupees in return for sterling, or for sterling in return for rupees?—Mr. Lindsay gives the figure of 1*s.* $4\frac{1}{16}$*d.*, as what people would have to give in England in order to get the rupee in India, and on the other hand they would have to give a rupee in India in order to get 1*s.* $3\frac{3}{4}$*d.* in England. That is Mr. Lindsay's view. Mr. Raphael seems to think that Mr. Lindsay's margin is rather too large, and that the limit ought to be less. That is a point upon which I have not sufficient practical knowledge to offer an opinion.

12,228. What is the difficulty?—One difficulty that has been suggested is that under Mr. Lindsay's scheme there would be really no remittance of gold either from England to India or from India to England, and consequently no real cost of remitting gold to serve as a gold point. In this state of things, a suggestion has been made that there should be no margin at all, and that the Government should in all

Rt. Hon. Lord Farrer.

1 March 1899.

cases be bound to convert sterling into rupees and rupees into sterling at the actual par of exchange. But this would involve a total abolition of the fluctuations in the real exchange caused by the ordinary operations of trade and remittance, fluctuations which are founded on a real difference of value between a gold coin in England and the same gold coin in India, and which have the wholesome effect of helping to redress the balance of liquidation. Whatever might be the true balance between the two countries, no one would give more than 1*l.* sterling for 15 rupees, if he knew that the Government would cash any quantity of sterling in rupees at that rate: and no one would give more than 15 rupees for 1*l.* sterling if he knew that the Government were bound to give any quantity of sterling for rupees at the same rate. Under such a system the Exchange Banks would cease to do what is not only a profitable business to themselves, but a business important to trade; and the Government would in all probability suffer loss. That there must be a margin is clear; and it is no less clear that there is a difficulty in fixing the margin, as I have stated before. That is an argument against Mr. Lindsay's scheme and in favour of having a gold currency in India; in which case the real exchange would be automatic, as it is between gold countries.

12,229. But that difficulty is inseparable from (to quote Sir John Lubbock's phrase) any exchange standard—the difficulty that there must be a margin?—Yes, if you are to fix it arbitrarily.

12,230. If you are to have an exchange standard, it must be an arbitrary standard?—Yes; only that, if you fix your rupee at 1*s.* 4*d.* and you have a gold currency in India, then the exchange of gold in India for gold in London, the remittance backwards and forward, will settle itself.

12,231. It will depend on the real value of the coin in both cases?—Quite so.

12,232. But Mr. Lindsay's scheme does not depend on that?—No; it is artificial.

12,233. And so is Mr. Raphael's scheme?—Yes.

12,234. And in fact the Government's too?—Yes.

12,235. You say that, if the margin is too small, it will unduly contract the wholesome fluctuations due to the state of the balance between the two countries; if it is too large, it will *pro tanto* unsettle the gold value of the rupee?—Quite so.

12,236. Would you give any opinion as to what it should be?—No; that is for bankers and practical men.

12,237. Now, what do you say about the agency by which this new currency should be managed, assuming such a currency to be adopted?—The answer to this question will depend to some extent on the question whether the gold reserve is to be kept in India, or, as in Mr. Lindsay's and Mr. Raphael's plans, in London. If the latter, it would, it seems to me, be desirable to place the whole management of the gold reserve in the hands of the Bank of England. When once the ratio of the rupee to the £ sterling is determined, the function of maintaining convertibility and of keeping a sufficient reserve for that purpose in the face of whatever fluctuations, seasonal or other, may occur, is essentially a banking function, such as the Bank of England and other banks have to deal with in their ordinary business; and I believe it would be better done by them than by the Government, and would be kept apart from the ordinary financial operations of the Indian Government. At the same time the Government of India cannot under any scheme avoid the responsibility of keeping in India, and, if necessary, of coining, as many silver rupees as are likely at any given moment to be in demand. How this should be effected, whether it can be facilitated by the issue of notes in India, and how the accounts between the Indian Government and the bank should be kept, are points on which I am incompetent to offer an opinion. The Indian Government must of course in some form or other pay and indemnify the bank; and I should like, in Mr. Raphael's emphatic words (6459) to see not only "the Indian Government but the English "Government support the scheme with its entire "credit."

12,238. If the English Government supports the scheme with its credit, then a great many of the difficulties would disappear at once about the gold reserve?—Entirely.

12,239. That would practically solve the question?—That would solve the question, I believe.

12,240. Now, will you proceed with your statement?—Whether Mr. Lindsay's scheme be adopted or not, and whether it is determined to have a gold currency in India or not, I should be glad if it were found possible to commit the management of the scheme to the Bank of England or to some other bank rather than to leave it simply and entirely in the hands of the Government. I believe they would manage it better; it is part of their business; and I do not at all desire to see a system in which the Indian Government put a quantity of gold in their shop window and ask everybody to look and see from day to day how big it is.

12,241. In fact you would prefer bank management to Government management?—I should.

12,242. Have you at all thought over the possibility or wisdom of establishing a bank in India that should do for India what the Bank of England does for this country?—I have not sufficient knowledge of India to go into that.

12,243. You have seen Mr. Alfred de Rothschild's paper?—I have heard of it; I have not read it.

12,244. Do you think that a complete and final scheme with absolute convertibility should be adopted at once, or that more experience should be acquired before that is done?—I regret that the imperfect scheme of 1893 should not have been allowed a somewhat longer trial before throwing it again into the crucible. The circumstances of the last five years have been in many respects exceptional, and the experience of two or three more years, without war, without famine, without pestilence, and without exceptional borrowing, would have been very desirable for the purpose of establishing the fact that the currency of India at the gold value of 1*s.* 4*d.* for the rupee is not normally or permanently redundant; in other words that trade and business have accommodated themselves to that value, subject, of course, to seasonal fluctuations. Even if the rupee were still normally redundant at that value, the contraction arising from the natural waste of currency and the increasing demands of business would no doubt soon bring it up to that rate without any such violent operations as the Indian Government propose. But, if it is thought desirable to adopt a complete scheme at once, I have no doubt that an undertaking to secure the convertibility of the rupee at 1*s.* 4*d.*, especially if backed by the credit of the English as well as the Indian Governments, would now and henceforth maintain the token rupee at that value. The great difference between the immediate adoption of a final plan and a policy of waiting, is not a difference of principle, but of policy and regard for public opinion. If the experience of the present year should be confirmed by the experience of one or two consecutive years, and if the rupee should continue at or near 1*s.* 4*d.* for that time, men will have become accustomed to it, and the operation of guaranteeing its convertibility, which now appears to some people heroic, will not appear heroic at all. Under these circumstances it is a question of practical politics, whether to establish a system of convertibility at once or to wait for the experience of two or three years. But, whichever course be adopted, it is a *sine quâ non*—if the currency of India is to be placed on a sound footing—that the Governments both of India and of England should allow no doubt whatever to exist about their intention to establish and to maintain the gold value of the rupee at the fixed ratio, by undertaking to convert it either now or hereafter at that ratio. When specie payments were

resumed in England, or rather when the bank was compelled to pay its notes, it was done by degrees.

12,245. You mean in 1819?—Yes.

12,246. It was spread over four or five years, I think?—Yes; but the effect of saying that they would do it at the end of three or four or five years was to raise the value at once to par.

12,247. You say that the imperfect scheme of 1893 should have been allowed a longer trial. If Sir David Barbour were here, he would say that an essential part of the scheme of 1893 was the introduction of a gold standard?—Undoubtedly Sir David Barbour always intended that, and I think you will find that Lord Welby and I expressed a strong opinion to that effect.

12,248. I mean, he regarded the introduction of a gold standard as the scheme, and this was the first step in it?—Certainly.

12,249. It was part of the original scheme that there should be a gold standard?—Certainly. I would never have signed the Report of 1893 unless I had believed that it would lead to a gold standard.

12,250. (*Sir F. Mowatt*). You have dwelt on the great importance of guaranteeing the maintenance of the rupee at whatever figure is agreed upon, either now or in course of time, and you have said that that would be greatly facilitated "by the English Government giving it its entire support." Will you define what you mean by the English Government giving it its entire support?—Suppose, for instance, the English Government agreed with the Indian Government to ask the Bank of England (I am only giving this as an illustration) to undertake the business. If the Bank of England did undertake the business and dealt with this as a part of their business, adding to their own reserve for the purpose, and did it at the request of the Indian Government and the English Government, I should say that the Indian and the English Governments would both have agreed to support the Bank of England.

12,251. You mean the English Government should in some way undertake to recoup the bank any loss which the management of the rupee cost?—The repayment of the cost must be a matter of arrangement.

12,252. I should say the loss on the transaction?—It would rather mean this, would it not? Supposing that there occured one of these extreme cases in which there was a great run, and in which something equivalent to the suspension of the Bank Charter Act had to be effected, then the Government would come to the assistance of the Bank of England, just as they would in an extreme case in London.

12,253. Then you are not contemplating that the English Government would simply guarantee a loan, either limited or unlimited, issued by the Indian Government in order to ensure convertibility?—I was not thinking of that particular form. I do not think that would be necessary.

12,254. Would you contemplate a loan, or a reserve established by loan by the Indian Government?—That is really a matter of arrangement for the Indian Government. I should myself prefer to contemplate some such plan as the Chairman suggested, of accumulating surpluses, rather than anything heroic in the way of borrowing; but there might be a time when the reserve became very low, and it was necessary to replenish it, and when that could only be done by borrowing.

12,255. And you think that that borrowing should be by the Indian Government, supported by a guarantee of the English Government?—I should be glad to see that.

12,256. You include that in the "entire support" of the English Government?—Yes.

12,257. Now, you have spoken of the gradual introduction of conversion. Have you considered at all how to ensure a gradual introduction of convertibility?—I think it must be a question of time. In the English case in 1819 they did it by raising the value of the note by steps till it came to par. That would not be necessary now, because, y[redacted] rupee at 1*s.* 4*d.* already, but you might say, go on for so many years, and at the end of so many years we will undertake to convert."

12,258. How would that be affected by, for instance, the rupee now for some reason falling below 1*s.* 4*d.*; how would the Government deal with that? Suppose people came and said, "You are guaranteeing convertibility; we want gold for these rupees"?—My impression is that, if you said you were going to undertake to convert either now or four or five years hence, the rupee would not fall below 1*s.* 4*d.*

12,259. It is on that conviction that you base this argument?—Yes.

12,260. (*Lord Balfour of Burleigh*). In the course of your answers to Sir Henry Fowler you said that persons hoarding rupees, if there are any who have hoarded them, would probably have taken advantage of the high price of recent times of close on 1*s.* 4*d.* to realise their hoards?—Yes, to secure having them in gold.

12,261. Yes, to secure having them in gold. Perhaps a large number of persons, some intelligent and influential people in India, might do so, but would that apply to the great mass of the population who may be supposed to have some hoards of rupees?—No, it would apply to those who thought about it; but I doubt very much whether under any circumstances the mass of the people would bring their rupees to convert them into gold. The rupee is useful to them as a rupee. I do not see why they should come to turn it into gold. The people whom you have to fear are those people who look forward and who think, "Gold will be more valuable at some future "time than this rupee is, therefore I will at this "advantageous juncture turn my rupee into gold." Those are thoughtful and speculative people.

12,262. No doubt; but in theory the possibility of such a contingency as my first question indicated does add to the responsibility of the Government in undertaking what you propose?—To whatever extent that goes, that is so.

12,263. But the risk of that does not affect your opinion?—No, I do not think it does.

12,264. Just at the conclusion of that part of your evidence dealing with the matters on which you had a very confident opinion, you said that the manner of making the token rupee convertible into gold, by what stages and under what limitations such convertibility should be affected, are comparatively matters of detail?—Important matters, but still comparative matters of detail.

12,265. Are they not so important—certainly the limitations under which the convertibility is to be effected—as really to be the gist of the whole scheme?—I do not think so. For instance, it has been suggested that rupees should only be convertible if brought in certain quantities, or that they should only be convertible in the form of notes of a certain amount. That has been suggested as one scheme. I dare say other schemes might be suggested.

12,266. (*Sir F. Mowatt.*) When you say convertible in the form of notes, you mean that rupees notes should be exchanged for gold?—That rupee notes should be exchanged for gold.

12,267. (*Lord Balfour of Burleigh.*) Such a limitation as only receiving rupees in certain quantities might be desirable for large exporters and for large transactions, still, if the time came when there was any premium on gold as compared with 15 rupees to the sovereign, people would very soon amalgamate their hoardings and bring in the required amount?—I think they would if that occurred.

12,268. So that that limitation of only doing it in large quantities would not affect the ultimate liability of the Government?—I do not think it would. But it would offer less ostensible temptation.

12,269. And in fact, if things were to turn adversely to the Indian Government (I only put that hypothetically), that would be no protection for them?—I do not think it would.

[redacted]

Rt. Hon. Lord Farrer.

1 March 1899.

12,270. Have you formed an opinion at all in your own mind, either from reading the evidence or from any knowledge elsewhere, as to what would be the ultimate possibility or the worst of the liability which the Indian Government, more or less by your hypothesis supported by the British Government, would undertake?—It is impossible to say, but I can see no reason to suppose that the rupee, as a rupee, will not continue to be useful and valuable to the people of India as it is at present. I can see no reason for anything in the nature of a *débacle*.

12,271. The rupee will continue to be as useful to the people of India as a shilling or half-a-crown is for us to-day, perhaps even more necessary, but at the same time you might have to face the contingency of the people who now hoard rupees, wishing to turn a large quantity of them into gold. We must admit that a large quantity of rupees must always remain in the country as rupees, but admitting that, have you ever thought of what number of millions of pounds might be demanded in gold from the Indian Government?—No; of course the ultimate limit is the quantity of rupees that there are.

12,272. The quantity of rupees, having made the proper calculation of the number of rupees which people cannot get rid of?—That is, to take the quantity of rupees which there are in hoard, or the quantity of rupees which there are in the banks. Of course you must deduct from the whole quantity of rupees whatever number of rupees are actually needed for circulation.

12,273. You must take the quantity of rupees which there are over and above the necessities of the population?—Then you must allow me to say that, when you once take these away, you would increase the value of the remaining rupees.

12,274. No doubt, but you have not gone into that at all?—No, I have made no estimate of numbers. I doubt the accuracy of any such calculations: I doubt their value, if accurate. If all the rupees in India, or all the rupees except those absolutely required for purposes of circulation, were presented at one moment for payment in gold, the demand would no doubt exceed any possible reserve. The security is that no such demand is likely to be made. I should no more care to get out the result in figures than I should care to get out what the result would be if all persons in this country who have money at banks were to insist at one moment on drawing out all their money in gold.

12,275. (*Mr. Le Marchant.*) You said just now that, if there were a promise on the part of the Government of India, supported by the English Government, to make the rupee convertible into gold at some date, say, three or four years hence, that would prevent the rupee in the interval from falling below gold point?—I am inclined to think so.

12,276. On the other hand, is not the rate of exchange often determined by the balance of immediate payments?—No doubt that is so; but I think that, if people knew that the rupee would, after a certain time, be convertible into gold at 1*s.* 4*d.*, that would have a very great effect in maintaining its value in the face of adverse circumstances.

12,277. How would that operate; would it be by inducing the banking world to send capital to India?—I am inclined to think so. I think they would have a belief in the future of the rupee.

12,278. In fact, that it would be profitable to provide funds and exchange, quite apart from Government action?—Yes.

12,279. Do you consider that the introduction of a gold currency would lead to a greater demand for gold, in order to take the place of rupees?—That is a thing which I am not capable of judging, but, as far as I can gather from the evidence, it seems that the great bulk of the transactions must for a long while be done in rupees, and that it will be a long while before there is a large use of gold in India compared with the other currency. There might be a certain quantity of gold in the banks.

12,280. Of course, during the last year, while the rate of exchange has been about 1*s.* 4*d.*, there has not been, so far as one knows, any offering of rupees for gold to an exceptional extent. But that has been the case while gold is not a currency?—Yes.

12,281. So that any demand under present circumstances would merely be for gold as a commodity?—For gold as an investment.

12,282. Do you think that would be changed, if gold became a circulating medium; do you think that would introduce a new condition?—That is a question for people who are better acquainted with India than I am; so much depends on the habits of the people of India. So far as I can judge from the evidence, they are so accustomed to the rupee that they would be very little likely to use gold in the ordinary circulation even when it became legal tender.

12,283. You were alluding to the rate of 1*s.* 4*d.*, as having now prevailed for about a year. Do you regard the duration of time as important for enabling an inference to be drawn as to the suitability of the rate?—I think the fact that it has lasted a whole year, through slack times and through busy times, is very much in its favour.

12,284. And, if the time were longer so that the inference could be drawn from a more extended period, that would fortify any conclusion?—Certainly.

12,285. It has often been suggested that the existence of a maximum of 1*s.* 4*d.*, without a corresponding minimum, must operate against the reception of gold into the Indian Treasuries?—Yes, because people are not certain that they will be able to get their gold back again at the same rate, if they want it by and by.

12,286. Do you consider that the disadvantage applies more to the particular rate of 1*s.* 4*d.* than to any other rate, or do you view it as a general principle?—As a general principle.

12,287. (*Mr. Holland.*) You say that in your view the re-opening of the mints to silver is out of the question. Would you contemplate ever re-opening them under any circumstances, or do you think that, being closed, they are closed for good?—I think I told the chairman that I should hesitate to say that any opinion I formed was absolutely final, because circumstances may change, circumstances which we cannot foresee and over which we have no control; but, so far as I can see at present, and so far as existing circumstances may be expected to last, I can see no prospect or likelihood of its being desirable to re-open the mints to silver.

12,288. Referring to the guarantee of convertibility by the Government, do you consider it to be the proper function of the Government to undertake responsibility of that kind?—Certainly.

12,289. You say that you consider 1*s.* 4*d.* to be the best rate, and one of the grounds of considering 1*s.* 4*d.* best, is that it is the rate that obtains just now?—Certainly.

12,290. But I believe you were in favour of the rate of 1*s.* 4*d.* at a time when the then existing rate was much lower than 1*s.* 4*d.*?—It was 1*s.* 2¾*d.* or something below 1*s.* 3*d.* at the time, but it had been much above that very shortly before, and the Indian Government had proposed to raise it still higher; of course 1*s.* 4*d.* is arbitrary, but it was thought that that was a fair point to take—that the Indian Government should have power to raise it to 1*s.* 4*d.*, but should not have the power to contract the currency so as to raise it beyond 1*s.* 4*d.*

12,291. You probably agree that, allowing 1*s.* 4*d.* might be easily maintained when harvests are good, the task would become very much more difficult if there were to be unfavourable crops?—Of course, if the balance of trade is unfavourable, the tendency is to lower exchange, but once established there it remains, crops or no crops; it does not depend on the crops; you are not to have a standard varying with the amount of your exports or imports. Your object

is to get a permanent stable standard. What I deprecate above all things is any attempt to manipulate currency for the purpose of promoting exports or of interfering with trade. We want a stable standard of value.

12,292. You say that in your view it is indispensable that a gold reserve should be accumulated. I suppose you would agree that, as a matter of fact, not very much has accumulated so far?—No, I suppose there is no accumulation at present, but we hear that a certain quantity of gold has gone to India.

12,293. Do you think that the reason it is so small, or one reason, at any rate, is that only 15 rupees have been offered for the sovereign; do you think that, if 16 rupees had been offered for the sovereign, there would have been a larger accumulation at this time?—That I cannot say, but I think that the real reason why there has not been more, is that there is not an inferior as well as a superior limit to the gold value of the rupee.

12,294. (*Chairman.*) You are not referring now to the unknown hoards of gold, of course?—No, I am referring to gold available for currency purposes.

12,295. (*Mr. Campbell.*) Mr. Le Marchant asked you some questions as to the rupee falling below 1*s.* 4*d.* if the Government guaranteed convertibility within a certain time, and you expressed the opinion that it would probably not go below 1*s.* 4*d.* if convertibility were guaranteed in that way?—I am inclined to think so.

12,296. But you are aware that the Indian Council must sell its bills every year?—Yes.

12,297. Then, supposing that the balance of trade were such as to prevent the Government selling the Council bills except at a lower rate than 1*s.* 4*d.*, would not that tend to send the exchange below that point?—I suppose that would be so. If the Government could not sell their bills at 1*s.* 4*d.*, that would mean that the exchange had fallen—of course it would.

12,298. Then, would you suggest that the Council should hold for 1*s.* 4*d.*, or meet the market and sell at current rates?—This is a point for practical men rather than for me, but the inclination of my opinion would be to keep the currency question totally separated from the other financial questions of the Government of India.

12,299. That means to sell the council bills at whatever rate they could get?—At whatever rate they could get, but at the same time with the duty of those who managed the currency department to keep exchange at 1*s.* 4*d.*

12,300. How would they do that?—By making the rupee convertible at 1*s.* 4*d.*

12,301. That would mean borrowing to maintain the rate?—It might mean that.

12,302. With regard to the gold standard with a gold currency as well, would you consider it one of the advantages of a gold currency that, during a time of adverse trade balance, that adverse balance could be adjusted automatically by the shipment of gold?—Yes, I consider that a considerable advantage.

12,303. It would be an advantage in favour of a currency as compared with a mere standard?—Yes.

12,304. Then you object to borrowing, if it could be avoided, for the purpose of maintaining the standard?—If it were possible to get the necessary reserves without any heroic borrowing I should be glad to see it done.

12,305. But, if it were not possible otherwise, you would not hesitate to borrow if it were absolutely necessary?—No.

12,306. (*Sir F. Mowatt.*) For the purpose of maintaining exchange?—For the purpose of maintaining exchange.

12,307. (*Mr. Campbell.*) Then, having once given way and begun to borrow for that purpose, where are you to stop?—It is possible that we may be wrong. It is possible that exchange may go down; it is possible in that case that you would have to make some change or adopt some heroic remedy. I do not think it is likely, but it is a possibility.

12,308. It is a very serious possibility?—It is a possibility in this country that the Bank of England, or the banks may not be able to meet the enormous liabilities to which they are subject every day, but it is a possibility which we disregard. We have to act on probabilities, and to adopt the scheme which has most advantages and fewest disadvantages.

12,309. If this possibility that we are speaking of arose from the fact that a wrong ratio had been adopted between gold and the rupee, that is a very serious question in considering what ratio should be adopted?—I do not understand what is meant by a wrong ratio. There is no such thing as an absolutely right or an absolutely wrong ratio. There is an existing ratio which may be either raised or lowered. It is an evil either to raise or lower it. It is quite as great an evil to lower the ratio as to raise the ratio.

12,310. With regard to the Lindsay scheme, and other schemes for raising the ratio to 1*s.* 4*d.*, would you say that, if that ratio is a proper ratio, it should not require artificial support to maintain it?—I am not quite sure that I understand what you mean by artificial support.

12,311. Borrowing?—Any scheme artificial or not, any system of guaranteeing the convertibility of a token currency, may mean borrowing at times. I understand the Bank of England borrow at times.

12,312. They borrow at times to raise the discount rate you mean?—Yes.

12,313. But would you not say that, if a scheme is the correct scheme, it should not need artificial support, it should work automatically and that, if it requires artificial support, that very fact tells against it?—Yes, but I am not quite certain that I see how the Lindsay scheme requires artificial support any more than a gold currency would; because, if there was a gold currency and the gold currency was all departing, it would be necessary for the Indian Government in that case to have recourse to some such procedure as borrowing.

12,314. I mean with the ratio of 1*s.* 4*d.* Mr. Lindsay's scheme contemplates the establishment and maintenance of the ratio at 1*s.* 4*d.*?—If you are afraid of 1*s.* 4*d.* being too high, allow the present state of things to go on for two or three years; allow the currency to contract itself with reference to the demand; and you will make the 1*s.* 4*d.* rate more secure than it is at present.

12,315. You admit that the ratio is an important part of the question?—To fix upon a certain ratio is important, but the still more important thing is when once you have got a ratio not to change it.

12,316. Once you have the correct ratio?—I am not quite certain whether you and I are agreed upon the fact of there being a correct ratio.

12,317. What would you take to be the test?—The test of a correct ratio is that trade and prices have adapted themselves to the ratio that exists, in other words that the currency is equivalent to the demands upon it, neither redundant or scarce.

12,318. The Government adopted, on the recommendation of Lord Herschell's Committee, a ratio of 1*s.* 4*d.*, but for a long time, as you are aware, the actual fact was that the rate of exchange was very much below that?—It was so for special reasons. Lord Herschell's Committee did not recommend a fixed ratio of 1*s.* 4*d.*; they recommended that the Indian Government should not have power to contract the currency so as to raise the ratio above 1*s.* 4*d.*

12,319. Now, if the mints were closed to silver and a ratio named for the reception of gold, do you believe that the need for fresh currency would make that ratio effective sooner or later?—Yes, I think that it would. I am not sure—you know and I do not know—what is happening just now; but I am told that a considerable quantity of gold is going to India at this moment.

12,320. Would you consider that evidence that 1*s.* 4*d.* is a proper ratio?—It is evidence in support of the view that it is a proper ratio.

12,321. Supposing 1*s.* 6*d.* had been fixed upon instead of 1*s.* 4*d.*, would you say that it would only be

Rt. Hon. Lord Farrer.

1 March 1899.

a question of time until the contraction of the currency made 1*s.* 6*d.* equally effective?—Yes, I do; but one must remember that all that period of the contraction of the currency is an evil, and that what you want to do is to get as near as you can to the ratio that now exists.

12,322. The point I want to make is this. Is the fact that 1*s.* 4*d.* has been arrived at after this long period sufficient evidence that it is the proper rate any more than 1*s.* 6*d.* would have been?—The 1*s.* 4*d.* is nearer to what was then in existence and is now the ratio to which things have adapted themselves. There is no divinity in 1*s.* 4*d.*

12,323. Do you remember Mr. Bertram Currie's proposal to leave the ratio unsettled altogether and to allow the exchange to rise indefinitely?—I do. I was never able to understand it.

12,324. You would not approve of that as a proper means of finding the ratio?—Certainly not. The effect would have been that the currency would have contracted indefinitely by waste, by stoppage of supply and increase of demand, and the ratio or rate of exchange would also have increased indefinitely.

12,325. But is not naming an artificial ratio which, whether right or wrong, the contraction of the currency will in time make effective, merely a variation of Mr. Bertram Currie's proposal?—You may so describe it if you please, but it would be a greater change than the change that has been made and an unnecessary change, and one which would in its progress cause great friction and difficulty.

12,326. (*Chairman.*) I suppose an arbitrary Government might fix it at 2*s.*?—Certainly.

12,327. And smash the trade of India almost in doing it?—Yes. I should like to add one word on the expressions "natural ratio" or "correct ratio" and "artificial ratio." When you can manipulate a token currency there is, properly speaking, no such thing as a "natural" or a "correct" ratio as distinguished from an "artificial" ratio. The ratio depends on the value of the currency; in other words, on the proportion of supply of currency to the demand for currency. If you diminish the supply by contracting the currency, you raise the value and the ratio. If you increase the supply, *e.g.*, by issuing forced paper or by allowing a depreciated metal such as silver or copper to be coined *ad libitum*, you diminish the value and the ratio. Either process may be unlimited, and appreciation or depreciation of the rupee may therefore also be unlimited. But, although you may thus alter the ratio indefinitely, there is, when a given ratio has existed for some time, a certain fixed relation between the currency at that ratio and prices of all kinds, which it is extremely undesirable to alter; and which on the other hand it is extremely desirable to stereotype. This it is now proposed to do by making the currency convertible into gold at 1*s.* 4*d.* It will then only vary automatically with gold. You may, of course, contract the currency and make the ratio 1*s.* 6*d.* or more; or you may depreciate the currency and make the ratio 1*s.* 3*d.* or less. But these ratios will be no more "natural" than 1*s.* 4*d.*; and to adopt either of them at this moment would have the bad effect of creating an unnecessary disturbance in all existing business relations.

Let me add that, if you adopt a ratio of 1*s.* 3*d.* instead of 1*s.* 4*d.*, you may for the moment find it easier to maintain the 1*s.* 3*d.* ratio. But, when prices and business arrangements have once adjusted themselves to the 1*s.* 3*d.* ratio, it will be just as difficult to maintain that ratio in the face of adverse circumstances as to maintain the 1*s.* 4*d.* ratio.

The witness withdrew.

Mr. J. M. Macdonald.

MR. JOHN MATHESON MACDONALD called and examined.

12,328. (*Chairman.*) You are a member of the firm of Matheson & Co., of 3, Lombard Street?—Yes.

12,329. All your business life has been spent in London?—Yes.

12,330. But you have been connected during the whole of your business life with the Eastern trade?—More or less.

12,331. You have had special experience, I believe, in the Chinese trade?—Yes; we have always done a large business with China.

12,332. Shanghai, I suppose?—Yes.

12,333. Are you familiar with the cotton mill industry in China?—I have got up the information on the subject as well as I could, and I believe I have got pretty accurate information.

12,334. Is there any serious competition between the Indian cotton industry and the Chinese cotton industry at the present time?—The impression I have gathered is that the Chinese cotton industry can hold its own with Bombay, leaving out entirely the question of the advantage of the silver premium on rupees; that is to say, if Shanghai and Bombay were competing on the same currency, I believed China would hold its own. Of course, with the enormous advantage of the inflated rupee, I do not think Bombay has any chance, except as supplementing the production of the Chinese mills.

12,335. You mean that, irrespective of that advantage which China enjoys, if China did not have that advantage, she would still be able to compete successfully with India?—Yes, I think so.

12,336. When were the foreign factories first started in China?—The strictly foreign factories have only been started in China since the close of the Japanese war in 1895. Prior to that they were not allowed to import machinery or erect mills.

12,337. On what ground do you think China can favourably compete with India?—Labour is extremely cheap.

12,338. And coal is cheap?—Yes.

12,339. Raw material?—The raw material is at hand. It is a little higher in cost than the Bombay material, but the yarn produced from it fetches a higher price.

12,340. And it is nearer the market?—Yes.

12,341. (*Sir F. Mowatt.*) When you say labour is cheap, do you mean as compared with Indian labour?—I think so, so far as I can gather. I have not wished to exaggerate, and therefore I have taken Indian labour at the lowest rate, so far as I could ascertain the figures.

12,342. I only wanted to understand whether you meant cheap as compared with Indian labour?—I think the very cheapest labour in India is about on a parity with the cheap labour in China, but I think in India a larger number of persons at higher rates of wages are employed in the mills.

12,343. (*Chairman.*) Up to what numbers do they make in China now?—Up to 20's. At this time I think they have over 300,000 spindles. At present they find yarn is a more profitable production than cloths, but they do manufacture certain coarse cloths of narrow widths, in imitation of the Chinese native make.

12,344. Where is the yarn woven that they spin?—The yarn is woven by the native weavers.

12,345. By hand?—Yes.

12,346. Are there many power-looms?—For weaving do you mean?

12,347. Yes?—I do not think there are, except in the foreign mills.

12,348. The production in China is the production of yarn, the weaving being by hand-loom chiefly?—Yes, chiefly.

12,349. Have you any idea what is the supply of native cotton?—As an indication of the supply, I notice that an amount of about 3,000,000 of bales passes through the Imperial Maritime Customs.

12,350. Into China?—Not into [redacted]oving in China from one place to anoth[redacted]rse an

enormous quantity is used locally and never comes through the Customs at all.

12,351. That is China-grown cotton?—Entirely.

12,352. Do they import from America?—A little, and they have imported from India, but that is falling off.

12,353. There is an unlimited supply of labour?—Practically unlimited.

12,354. Both men and women?—Yes, women and children are chiefly employed.

12,355. Do the local yarns pay no duty?—Not within the Shanghai Settlement, but if they go outside they are on the same footing as all other yarns.

12,356. There are heavy import duties?—Yes, they are the *Likin* duties, but that applies to all, so that I have not gone into that.

12,357. Is there any competition between India and Japan?—Yes, very much. I think Japan follows China. The order I should say is Shanghai first, then Japan, then India.

12,358. That is to say Japan is more favourably situated than India?—Yes.

12,359. And then China?—China is more favourably situated than Japan.

12,360. But trade is more developed in Japan than in China?—Yes, they started earlier in Japan.

12,361. Now, what other manufacture is there in which Chinese enterprise and Indian enterprise come into competition besides cotton?—Tea and opium.

12,362. Is the production of tea in China diminishing or increasing?—Diminishing; that is to say, the production may not have diminished, but the export to this country has diminished enormously. There is still a considerable export kept up to America and other places. The Americans take mostly green teas and Oolongs, and the Indian teas have not yet captured that market. Then again, a good deal of China tea goes to Russia—the best tea.

12,363. What about opium?—Opium, I am quite satisfied, is doomed as regard India. The revenue has fallen off to half what it was, and the rest will certainly follow.

12,364. The Chinese are growing their own opium?—Yes.

12,365. The consumption, I suppose, is increasing?—Yes, I should think so.

12,366. But that increased consumption is supplied by native-grown opium?—Entirely.

12,367. Then it is practically a question of tea and cotton?—Yes.

12,368. The tea trade to some extent?—Yes.

12,369. What have you to say under the heading of tea?—As regards tea, my opinion is that, while China tea has the advantage of the exchange to the full extent, this is very largely counterbalanced by other factors. First of all, there is the export duty. That amounts on all tea to about 0·6 of a penny, and, as the bulk of the China tea now exported is of extremely low quality, it forms a very heavy percentage.

12,370. (*Sir F. Mowatt.*) The *Likin* duty does not affect cotton?—Yes, it affects cotton, but only locally. The cotton manufacturers in Shanghai are allowed to sell within the Settlement, free of duty. It is when the stuff gets outside the Settlement, that it is subject to duty. Then, the quality of tea has fallen off in China. Once any community acquire a taste for Indian tea, China tea becomes practically unsaleable.

12,371. (*Chairman.*) I suppose they have better machinery and so on in India than in China?—Whether it is due to that, or to better soil in India, I do not know, but Chinese tea is certainly inferior as regards strength and pungency to Indian tea.

12,372. And there is a great decline in the export to England of China tea?—Very great. I remember when the export was something like 160,000,000 lbs., it is now down to 30,000,000 or 40,000,000. Another factor is the local consumption, which, at a price, competes with the foreign demand. The effect as regards Indian tea is certainly to keep prices at a low average, that is, if the price of Indian tea goes up, there will probably be an increased export of China tea. There is a certain demand for cheap teas for mixing with Indian tea.

12,373. There is no local demand to any extent in India, is there?—None, and that of course entails the necessity on all persons who manufacture tea in India to ship it and sell it—to force a sale, in fact, in London.

12,374. I suppose, if there was a material rise of price in tea, that would be met by an increased shipment of cheap tea?—It would, to some extent.

12,375. Do you think there is any early prospect of China tea being grown and manufactured under European supervision?—No, I think not. There have been some trials made; there was a company got up at Hankow, and another at Foochow, but I believe they are both wound up.

12,376. What is the experience with reference to the Indian industry being affected by the restriction of the currency?—I think there can be no question about that. To restrict the currency of any country must affect the industries of that country.

12,377. And do you think there has been a restriction of currency in India?—Yes.

12,378. On what grounds do you base that opinion?—On the ground of the high rate of interest ruling, which was an inevitable consequence of closing the mints.

12,379. That may have been so last year, but it is altogether different now?—But circumstances have been very different this year. There has been an enormous export this year.

12,380. Was not there a famine last year?—Yes, and I think the effects of the famine were exaggerated in some respects by the restriction of the currency.

12,381. Now, what is the standard of value in China?—The standard of value in China is silver by weight.

12,382. Have they any coins?—The currency in China where they have coins is in the hands of the Local Government, but the Chinese Government—the Imperial Government—do not recognise any coins. If you have to pay duties at the port of Shanghai on imports, you are obliged to pay in silver.

12,383. By weight?—Yes, by the tael.

12,384. And of a certain quality?—Yes, I do not know what it is, but they will not accept coins of any kind.

12,385. (*Sir F. Mowatt.*) Not by weight?—They will accept coins as silver. Sir Halliday Macartney, the Secretary of the British Legation in London, informs me that "he considers the currency of China "is the silver Tael. The so-called copper 'cash' has "no uniform standard." Cash are of course largely used in retail payments and wages. The wages are so small that it is absolutely necessary to employ a subsidiary currency.

12,386. (*Chairman.*) The local dollars vary in weight and quality?—They do.

12,387. Mexican dollars are used?—Mexican dollars are used, but they are being supplanted very much now by the British dollars.

12,388. And Japanese yens?—Japanese yens were in use, but they are now being called in, because at the ratio recently fixed by Japan they were worth more in Japan than their intrinsic value as silver.

12,389. Is there any banking in China?—Yes, there is a very elaborate native banking system.

12,390. And well managed?—Extremely well managed some of it, so much so that the Imperial Customs in Shanghai, who will not, as a rule, accept anything except sycee in payment of duties, will occasionally accept an order on a native bank for the delivery of so much silver.

12,391. Is that the nearest approach they have to a paper currency?—No. In some districts, notes issued by the native banks are in general circulation. They also issue letters of credit which are available all over the district and readily encashed.

12,392. Is one of the great drawbacks to Chinese commerce the want of a proper and well-regulated currency?—It is an enormous drawback, especially

Mr. J. M. Macdonald.

1 March 1899.

to the lower classes. The question of the local exchange and currency arises in every transaction, and complicates business. The "cash" in which they deal are of various weights, and latterly some of them have been very much reduced in size. Then, all sorts of disputes arise as to the quality of the silver; at every turn such questions arise, and, of course, the money-changer has always an advantage in dealing with ignorant coolies and people of that class. The question of exchanges in the different districts comes in constantly, and must hamper trade.

12,393. How do you measure the range of prices in China?—I do not quite understand that question.

12,394. You say, "The range of prices in China "measured in silver seems to have followed the "indication given in Sauerbeck's Tables: namely, "that from 1873 to 1893 silver continued to be a "fairly steady standard as regards commodities, but "that since then prices of commodities have risen "12 to 15 per cent. measured in silver"?—I am speaking there of average prices. I have a table here which I have taken out of the average prices of commodities given in the Chinese Imperial Customs Returns:—

AVERAGE PRICES of COMMODITIES EXPORTED, in Harkwan Taels per Picul (133⅓ lbs.).

		1872–76.	1877–81.	1882–86.	1887–91.
Black Tea		22·56	17·42	16·20	17·08
Green Tea		26·95	21·80	20·57	18·31
Brick Tea		11·06	7·80	6·07	6·82
Silk Cocoons		88·00	55·88	55·62	59·59
Wool		6·81	6·77	8·33	8·46
Yellow Silk (Hankow)		153·20	176·69	201·81	195·46
Raw Cotton (Shanghai).		9.23	9·52	11·07	10·36
Rice (Shanghai)		1·20	1·35	1·40	1·44
Wheat (Shanghai)		1·16	0·97	1·25	1·25
Brown Sugar (Swatow?)		2·38	2·97	2·63	2·38
White Sugar (Swatow).		4·36	4·85	4·10	3·85
Bengal Cotton (Hong Kong)	highest	11·15	11·16	10·00	11·02
	lowest	6·17	6·17	5·06	6·40

During this period the quotation for bank bills on demand fell from 6*s.* 1*d.* per Shanghai Tael in 1872 to 4*s.* 3½*d.* in 1891, and in 1898 it had fallen to 2*s.* 8¼*d.* Then I have another table which is made upon the index-number system by the Consul at Shanghai, who is very much interested in this question, which confirms what I have already stated. Sir Halliday Macartney in his Memorandum says: "I "understand that the prices of all articles of common "consumption and wages have of late years slightly "risen in and around the Treaty Ports, but this rise "bears no proportion to the depreciation in the "exchange value of silver, and is not greater than "might have been accounted for by the effect of "prosperous trade."

12,395. Does "of late years" mean since the depreciation in the value of silver?—Since 1893. Consul Jamieson estimates that there has been a rise of some 14 or 15 per cent.

12,396. (*Sir A. Dent.*) Do Consul Jamieson's figures apply to Shanghai alone or to China generally? I suppose it is principally Shanghai.

12,397. (*Chairman.*) Let me read you this extract from one of the Consular Reports. "It has been "stated that, while the price of silver in relation to "gold has been going down, its purchasing power in "China has remained constant. This would only be "true if there had been no alteration in the "exchanges between silver and copper coin, and sup-"posing the value of the latter in relation to other "commodities had remained unchanged. As a "matter of fact there has been a steady rise during "the last few years in the silver price of cash. The "year 1896 has witnessed a further considerable rise "throughout China, attributed partly to scarcity and "insufficient minting of the coin, so that the tael, "which formerly exchanged for 1,500 cash, will now "only purchase 1,200 or less. Side by side with this "increase in the silver price of cash, there has also "been a marked tendency for the cash itself to depre-"ciate in regard to commodities in general, so that the "gold-price of Chinese commodities has not fallen to "an extent by any means so great as has been "generally assumed from the decrease in the exchange "value of silver." Do you agree with that?—No, I do not fully agree with it.

12,398. Where do you disagree?—I think the price of cash has not varied so much as is supposed, and that, so far as the price of cash has varied, it has done so more from the contraction of the currency—by scarcity of cash—than from any change in its intrinsic value.

12,399. (*Sir F. Mowatt*). Let me call your attention to one single expression. He says: "The year "1896 has witnessed a further considerable rise "throughout China." It is not merely in the neighbourhood of the ports, but throughout China?—Yes, I agree with that. Since 1893 there has been a rise in prices of commodities measured in silver.

12,400. I thought you said only in the neighbourhood of the ports?—That applied to the table of prices of exports.

12,401. (*Chairman.*) At Shanghai Consul Jamieson gives us a table in which he shows the increase in silver prices, from 1887 to 1897, viz., 49 per cent. so far as regards rice, 82 per cent. in flour, 66 per cent. in eggs, 36 per cent. in pork, 58 per cent. in fish, 70 per cent. in vegetables, 75 per cent. in oil, 43 per cent. in sugar, 55 per cent. in salt, and 50 per cent. in house rent.?—I have not seen that table. Latterly there has been a rise.

12,402. Would that at all show that the cost of production in China is increasing?—Yes, it is now.

12,403. Now we will go from China to India. First of all, what was your opinion about the closing of the mints?—I disapproved very much of the closing of the mints.

12,404. The mints having been closed, what do you say about their now being reopened?—I should prefer their now being reopened.

12,405. At once?—Yes, I think at once.

12,406. You think there would be no disturbance of trade?—There would be a disturbance of trade for a time, but I think a change of that sort very soon rectifies itself, and it is less detrimental to trade than a period of suspense.

12,407. Has there been much suspense for the last 12 months?—There is at present a feeling of suspense.

12,408. The rate of exchange has not varied, has it?—No, but no one has any confidence in it. It has been steady from exceptional circumstances, I consider.

12,409. Suppose the mints were now open, I suppose the rupee would go down to the bullion price of the silver that it contains, would it not?—The value of the rupee would fall to some extent, but I think the price of silver would rise also.

12,410. Are you in favour of a gold standard?—Of course, one has to consider the question of a gold standard from every point of view, and I see very great difficulties in establishing one. I should prefer that a silver standard were retained in India, speaking as a merchant, because I think it would be more conducive to the prosperity of the country.

12,411. I want you to look at it for the moment from the merchant's point of view. India does a large trade with you as a London merchant?—Yes.

12,412. The trade that is done with you is on a gold basis, is it not?—I do not know that I would say so.

12,413. You do not think that it is?—I do not think so.

12,414. Do you mean that the gold price is not taken into account when you buy and sell?—Yes, you have to do that, but exchange is a factor.

12,415. I am coming to that in a moment. I want first to get this fact, the gold price is taken into account in your trading?—It is based on the gold price certainly.

12,416. Then that is subject to fluctuations of value?—Yes.

12,417. That is not a desirable state of things?—It is unavoidable.

12,418. Many things are unavoidable which are not desirable. I want to know whether in your opinion it is desirable for a silver-using country which does a large trade with a gold-using country to have no par of exchange?—It would be better, of course, with a par of exchange.

12,419. What is your reason for thinking silver a better standard than gold?—It has retained its value relatively to commodities up to a recent date much better than gold has. The alteration has been by the appreciation of gold and not by the depreciation of silver.

12,420. Personally you would be in favour of getting back to open mints and for the exchange to depend upon the bullion value of silver?—Yes, and one strong reason for that, I should say, would be this; I do not see how you are ever to have an automatic currency unless on that footing.

12,421. What is the difficulty that presents itself to your mind?—Do you mean with a gold currency?

12,422. The difficulty in the way of an automatic currency?—Well, there is a distinct difference between an automatic currency and what you may call a managed currency. With silver you may have an automatic currency which is undoubtedly the most desirable from every point of view. With a managed currency—of course it can be done, there is a large experience in this world of countries that are worked upon a managed currency—but the difficulties in the way are enormous, and very much greater in the case of an English dependency than in the case of any other country.

12,423. I do not think I quite understand what you mean when you talk about a managed currency?—By a managed currency I mean one in which the Government controls the currency. In an automatic currency the Government does not interfere at all. It is simply the agent to certify to the fineness and the quality and the weight of the coin.

12,424. What do you call the silver currency of this country?—The silver currency of this country is a mere token currency.

12,425. It is a mere token currency, gold being the standard?—Yes.

12,426. What would be the difficulty of applying that to India?—That is to say, having a gold currency in India?

12,427. No; a gold standard with a token currency?—One difficulty would be that it is inevitable that a very large proportion of the currency in India must always be silver. It is very undesirable from many points of view, that the token currency should bear a high percentage to the gold currency.

12,428. Will you apply that to England? A considerable proportion of the currency of this country is silver?—No; I think it is very small. In the United Kingdom the amount of silver per head is estimated at 12*s.* 9*d.*

12,429. The silver currency of this country is 25 per cent. of the gold currency; it is from 22 to 23 millions of silver in circulation among 40 millions of people. Of course, all these calculations per head, like a great many of the averages, are very delusive, because a large number of people use very little silver, they use gold, cheques, and bank notes; but the bulk of the people who do use silver use a great deal more than 12*s.* 9*d* per head?—No doubt.

12,430. In India the transactions of the bulk of the people must remain in silver, which is a token currency?—No doubt.

12,431. You object to its being a token currency, and you say it should follow its bullion value. Is it the fact that a large proportion of the transactions of the bulk of the population of this country are in silver, and that that silver is a token currency, and that the effect upon prices and the general user is in no way affected by the fact that 20 silver shillings are really worth only 10*s.* intrinsically?—I do not think that is so in this country at all, but I consider the token currency in this country is quite different to what the token currency in India would be with a nominally gold standard.

12,432. Because its convertibility is safe?—And it is comparatively small in proportion. And again, in this country so much business is carried on without the intervention of coin at all, whereas in India that is not the state of things.

12,433. We are not talking about the great mercantile houses; we are now dealing with the great mass of the wage-earning classes of England and the great mass of the wage-earning classes of India?—I do not think the coins in the pockets of those people affect the question; it is the standard currency which affects trade.

12,434. Your transactions between London and Calcutta are in gold?—They are.

12,435. Why should not a token currency be as safe and good for use within India as it is for England?—If India had no foreign trade it would be perfectly good there.

12.436. It would?—Yes.

12,437. It is the foreign trade that you have in view?—The foreign trade entirely. The rupee is good enough for the internal trade in India, but it is absolutely worthless for foreign trade, under existing circumstances.

12,438. You regard it as very important to establish confidence?—Yes. With all currency systems confidence is half the battle.

12,439. If confidence were established with the rupee at either 1*s.*, or 1*s.* 2*d.*, or 1*s.* 4*d.*, and continuity and permanence were secured, you would be satisfied with that system?—Yes, but I do not see how confidence is to be established by anything but a thoroughgoing and sound system of currency.

12,440. If the public knew that a sovereign would command 15 rupees and that 15 rupees would command a sovereign, would that establish confidence?—If they had that assurance and could count upon it, yes; but I do not see how they are to get it.

12,441. You would consider that the British Government and the Indian Government might ensure it?—At a very great cost they might.

12,442. What would the cost be? You said just now that the gold would only be used for exchange purposes?—Yes, chiefly for exchange purposes.

12,443. Where is the great cost?—I think that, if the present system were continued, it would be absolutely essential for the Government of India to establish an Indian bank, with the sole object of managing the currency; and that the Indian Government would practically have to hold the gold reserve of the trade of India; and that, in consequence of so large a proportion of the currency being in silver, the gold reserve necessary to be held by the bank to meet the fluctuations would be very large indeed.

12,444. (*Sir F. Mowat.*) Because of the large amount of business done in silver?—No, but because of the fluctuations of the foreign trade, for the settlement of the balance of trade. It would be necessary to hold a gold reserve which was equal to the drain at any one time. As long as the adverse balance was against India, the Government would have to see it through to establish confidence, and, if there was any question about their gold reserve being insufficient, of course confidence would be at once broken.

12,445. (*Chairman.*) Are you aware that the proportion of silver currency in Great Britain to the population and the proportion in India are pretty much the same?—I do not quite follow; do you mean per head?

12,446. I am taking the population as a whole. The population of British India is between six and seven times the population of Great Britain. So far

Mr. J. M. Macdonald.

1 March 1899.

as we can ascertain, the rupees in circulation are about six or seven times the silver currency in this country?—I accept what you say.

12,447. I mention that, of course, only with reference to the transactions of the bulk of the people. I think you and I are agreed that, so far as large transactions are concerned, silver has nothing to do with the argument?—So far as regards international transactions.

12,448. That is entirely a question of exchange?—Entirely.

12,449. And the external trade is conducted on a gold basis?—It is not at present, because gold is not available.

12,450. Your remittances are made in gold equivalents?—I should like to illustrate that in this way. The system of the exchange banks, for instance, is this: They buy bills at one rate and sell at another, the difference being their profit. In an ordinary way, with a perfectly steady exchange, they would be content with that. But suppose, for instance, some unexpected event happens, and that a bank finds itself having sold a large number of bills on London that they are obliged to cover, they cannot go into the market and ship gold, as they would do, certainly, if there were a gold currency; but they are obliged to go into the market and offer inducements for the manufacture of bills on London, and the only way in which bills on London can be manufactured is to offer the shipper an inducement to ship produce and draw against it; and the only way in which the bank can induce shippers to manufacture bills is to lower the rate of exchange to a point at which it becomes profitable to them to ship produce and draw bills.

12,451. But do you know that at this moment gold is being sent to India?—I understand there have been some shipments from Australia.

12,452. Large shipments?—A million and a quarter, or something like that.

12,453. Now, suppose the transaction, instead of being between England and India, were between England and France; the only element of variation in the rate of exchange as between England and France, would be whether it was a cheaper thing to remit the gold or to buy bills?—As between England and France?

12,454. Yes. Now, the exchange between India and England is liable to be affected by a third consideration, namely, the value of silver?—It is affected by the balance of trade, which is measured in the exchange. It is not affected by the value of silver at present, because the rupee is artificial.

12,455. It is not at present, but how was it a few years ago?—Now the rupee and silver are entirely different things.

12,456. That is exactly the point I want to get you to. Assuming that there was a fixed par of exchange between England and India, the only difference would be the cost of remission one way or the other—the balance of trade so to speak?—Yes, the balance of trade.

12,457. The exchange is stable at this moment; but, suppose it were rendered unstable, would not another element be introduced?—The element would be introduced that you would have to lower the rate of exchange in order to induce exports.

12,458. Would you not also have the question of the price of silver?—I think not at present.

12,459. Then what makes an unstable exchange?—The rate of exchange is simply regulated by the balance of trade.

12,460. By nothing else?—The exchange is merely an indication of the balance of trade.

12,461. How will you apply that to the remittances by the Government of India to this country? The Government of India, as you know, has to pay in England a large amount of interest on money borrowed in England for the purpose of constructing works in India; that has to be paid in London in gold. Now what effect has that?—That can only be paid by shipments of produce from India in excess of imports into India, with the addition of this debit balance.

12,462. You think that taxation is totally unaffected by it?—If exchange falls, of course the Government would have to pay a larger amount in rupees for the equivalent of that debt.

12,463. And you think the fall or rise of exchange depends solely on the amount of the exports?—Entirely.

12,464. You heard what Lord Farrer said about that this morning; he did not seem to agree entirely in that view?—I should have thought that that was a point on which there was hardly a possibility of difference of opinion.

12,465. (*Sir A. Dent.*) You spoke of 3 million bales of cotton goods having passed through the Imperial Customs of China. To what ports do those bales go. That is not taken from the Customs returns, is it?—My authority for that is a very valuable report compiled by the Blackburn Chamber of Commerce in 1896. I should gather from the way in which it was put that they got the information from the Imperial Customs, either from their published returns or directly.

12,466. As far as we had the returns, there is nothing like that quantity of cotton returned in the Yellow Books as passing through the Imperial Customs. If 3 million bales of cotton goods passed through the Imperial Maritime Customs, the production of cotton in China must be something most gigantic?—Well, I hesitated to give the opinion of the Blackburn Chamber upon that point because they add this statement, that 3 million bales had gone through the Imperial Customs, and that, "that was probably not more than one-tenth of the production of China."*

12,467. Therefore China produces 30 millions?—Yes, according to that. Of course with a population of something like 300 millions, all of whom are practically clothed in cotton garments, one can imagine that the product must of necessity be enormous.

12,468. I asked you the question in order to point this out. It does not pass through the ordinary Maritime Customs returns that we get?—I understood that it did.

12,469. Perhaps you will find that out definitely?—Latterly, since cotton mills were started in Japan, the export of cotton to Japan has increased enormously.

12,470. There is nothing like one million bales, I fancy?—Probably not. Then, of course, a great deal of this cotton is shipped to various ports to natives, for native manufacture.

12,471. If that report is correct, and that is what passes through the Imperial Maritime Customs, it is a most alarming thing for the future of India?—I will try and verify the figures.

12,472. That is about three times the amount of the American cotton crop?—There is a tabulated statement given showing the quantities at the various ports.

12,473. They appear to have made a ludicrous miscalculation. It is really only 300,000 bales?—I thought the figure was startling.

12,474. Now about tea. I think you said that the *Likin* and export duty amounted to 0·6 of a penny?—It is rather more than that; it is 2 taels 5 maes.

12,475. Are you not rather under-estimating that?—It entirely depends on the exchange you take it at. I have taken it at the current exchange.

12,476. Does the table that you have put in apply to Shanghai, or to the Treaty Ports generally, or to China as a whole?—The heading of the table in the China Return is "Average Prices of Commodities exported."

12,477. From what ports?—From various ports, and they give it in the various articles; black tea, green

* *Note added by witness.*—It appears the 3 million bales are the ordinary Chinese bales of 1 picul, or 133 lbs. each, and are thus equal to about 1 million American bales.

tea, brick tea, silk cocoons, wool, and so on, that is all Shanghai. Then, yellow silk, Hankow; raw cotton, Shanghai; rice and wheat, Shanghai; brown sugar is apparently Swatow; white sugar the same; Bengal cotton, Hong Kong.

12,478. The table does give the details?—Yes.

12,479. (*Mr. Le Marchant.*) With regard to the Russian demand for tea, I think you mentioned that Russia took chiefly Chinese tea?—Well, it has been hitherto Chinese tea. All that is taken from China must, of course, be Chinese tea, but latterly there has sprung up a considerable trade in Ceylon tea. They have had facilities for shipping it by the steamers of the Chinese Volunteer Fleet, which go to Odessa, or call that way, so that the trade is gradually gaining ground there.

12,480. And it is not necessarily displaced by the difference of price; that is to say, the relative cheapness of inferior China tea does not necessarily account for the increase?—Of course a great deal of the tea that is sent to Russia is very inferior to Indian tea; it is what is called brick tea.

12,481. Still, there is a preference for high-class teas in Russia?—Those portions of the community who pay the highest price get the highest class tea; it is very expensive.

12,482. Looking at the aggregate import of tea into Russia, there would be a considerable quantity?—Yes, an increased quantity.

12,483. Of tea at a good price?—It depends on what you call a good price. They are accustomed to very much higher prices than we have in this country, but the limit of consumption of high-priced tea is very small even in this country. In Russia they have a very heavy duty upon tea.

12,484. But, in spite of that, they take high-priced tea?—Yes. It is a country where they drink a large quantity of tea. All the people drink it when they have the opportunity.

12,485. (*Mr. Holland.*) You told us that since 1895 there had been eight cotton mills erected in Shanghai. How many spindles would that represent?—317,000 spindles, I think. About three of these mills were established before 1895 by the Chinese.

12,486. Are considerable extensions going on now?—No further mills are being added at the present time.

12,487. I hear that some manufacturers in Lancashire are very much alarmed at the prospect of increased competition from China?—I think that is inevitable.

12,488. You tell us that there are many advantages that the Chinese manufacturers have; amongst them being cheap raw material, vicinity of market, and cheap labour. Have you considered whether the labour, although cheap, is also efficient?—Most efficient. There have been for many years silk filature mills in Shanghai, and the superintendent of one of them stated that the Chinese women had learned in three months to be as efficient as Italian reelers would become in a twelvemonth. I am assured on all hands that the Chinese themselves have a remarkable facility for any work of that kind.

12,489. (*Chairman.*) Better than Indian workers?—That I cannot say.

12,490. (*Mr. Holland.*) You say that you "have "been much impressed by the heavy tax imposed on "the community, and especially the lower classes, "by the absence of a proper and well regulated "Government currency." Do you think the heaviness of that tax discounts to any extent their advantages?—I do not think it applies very much in Shanghai or to the foreign trade, it is more in the country districts.

12,491. You told us you are in favour of the reopening of the mints to silver?—I am.

12,492. Have you anything to say with regard to an international agreement? Would you reopen the mints quite apart from any international agreement?—I look upon an international agreement as almost impossible at present. I certainly would have been in favour of it. I have been a bimetallist for 30 years, and I think a great opportunity was lost when the question first came up.

12,493. (*Mr. Campbell.*) You mentioned that the China mills are not yet in full swing, although they were established in 1895?—They started in 1895; they began operations about the end of 1896; in 1897 they paid fairly; in 1898 the Japanese mills and the Bombay mills apparently had a falling off in the demand, and enormous shipments were made to Shanghai, and for a time the market was completely glutted; but I see that latterly they have again in some cases resumed working day and night, which they had been doing before. I also notice that one of the mills has recently sold its whole production for four months of this year in advance.

12,494. Then the Shanghai mills are in a prosperous condition at present?—I cannot say that. Last year they barely paid their way, but I should think it is only a matter of time. Of course they are not thoroughly organised as yet. Their labour is not perfect; and I dare say they do not understand the management of a mill very thoroughly.

12,495. They chiefly manufacture coarse cotton yarns?—Up to 20's.

12,496. And that class of goods chiefly competes with Indian products?—Yes.

12,497. So that China competes directly with India rather than with Lancashire?—Yes. The Lancashire coarse cotton yarns have been killed off a long time ago by Indian spinnings.

12,498. Is the production of cotton in China increasing?—As regards the production of cotton, when Indian yarn first began to be shipped in large quantities to China, the price of cotton fell, owing to the weavers buying Indian yarn to manufacture their cloth, instead of cotton, and for some time there was a tendency to decrease. Latterly, since the mills were set up in Japan and Shanghai, the tendency has been to increase.

12,499. (*Chairman.*) At any rate we have got this from you that there is an effective competition between China and India?—That is so.

12,500. (*Mr. Campbell.*) Is the production of cotton in China capable of great expansion?—I think so. The valley of the Yangtse is very much like the valley of the Ganges; for 600 or 800 miles up you can grow cotton.

12,501. You say you are of opinion that these Chinese factories will compete on favourable terms with India, apart from the question of exchange altogether?—I think so.

12,502. Do you consider that the fall in the dollar and tael exchange, since the Indian mints were closed, gives the China mills a further advantage in competing with the Indian mills?—Undoubtedly.

12,503. If a shipper of goods to China could formerly get his proceeds remitted at about 300 taels, and can now only get 199, he must get about 30 per cent. more in order to give him the same return?—Yes.

12,504. Have you any record of the prices in China in 1893, as compared with what they are now?—I have found great difficulty in getting the prices latterly; they are only tabulated at intervals. I have them up to 1895 in a Consular Return.

12,505. And there are import duties?—Yes.

12,506. Do you know what they are?—I have not gone carefully into that, because they would apply to all imports equally.

12,507. Yes, but if Bombay produce has to pay an import duty, that gives China a still further advantage, does it not?—No. Chinese manufactures have to pay the same import duty outside the Settlements.

12,508. But Indian goods have to pay an import duty before they get to Shanghai, have they not?—No, they have to pay an import duty when they reach Shanghai.

12,509. Whereas the Shanghai manufacturers pay no excise?—Yes, they do.

12,510. They pay an excise in Shanghai?—Yes.

Mr. J. M. Macdonald.

1 March 1899.

12,511. Equal to the import duty?—With the exception of what is used in the Settlement. The moment they leave the Settlement they are treated as foreign shipments.

12,512. But the foreign goods pay that also, and the foreign goods are subjected to an import duty before they leave the Settlement?—The foreign goods are subjected to an import duty whenever they reach China; the others are equally subjected to an import duty the moment they get out of the Settlement.

12,513. (*Chairman.*) Cotton goods made in Shanghai are in just the same position as the cotton goods from Bombay; that is, they have to pay the Customs duty?—That is so. You may put it in this way; that the one pays an export duty and the other an import duty in going out of Shanghai.

12,514. (*Mr. Campbell.*) But they both pay the import duty on going out of Shanghai?—Oh no! If you are right that would be an additional advantage, but I do not understand that that is so.

12,515. Now, you referred to opium, and you said you considered that opium is doomed?—I look upon it as doomed.

12,516. Why?—Because the advantage of the exchange is so great in China. The cultivation in China is extending enormously, and the Chinese Government get an equal revenue from the native-grown opium to what they formerly got.

12,517. You attach considerable importance to the question of the exchange in regard to the extinction of the opium trade?—Yes. I think probably the opium trade might have gradually died out in course of years, without any disadvantage in exchange, but when the mints were closed, of course that settled it.

12,518. You said you considered silver the most suitable currency for India?—Yes. I think it is an absolute necessity to a very large extent.

12,519. You object to a managed currency?—I do.

12,520. But, if gold were to go into the Indian Currency Department by ordinary trade influences without the intervention of Government at all, would you call that a managed currency?—With a debtor country I can hardly imagine gold going into and remaining there to such an extent as to supply the wants of the country for foreign trade.

12,521. Gold does go in to a very large extent?—Yes, at present.

12,522. Suppose gold were to go in under a proper system and with a proper ratio, it would not be in any sense a managed currency?—No, it would not be; that is to say, so far as that special item of it went, it would not.

12,523. Then, as regards the effect of exchange on trade, as to which Lord Farrer expressed certain views, what is your opinion as to the effect of a high or low exchange in checking or promoting a trade balance?—The effect of a high or low exchange is either to stimulate imports or check exports. A low exchange stimulates exports and checks imports; a high exchange checks exports and stimulates imports.

12,524. For example, if the Secretary of State has to draw 17 millions of Council Bills in the year, is it not natural that he would have to accept a lower rate than if he had only to draw 10 millions?—Certainly, other things being equal.

12,525. His drawing 17 millions instead of 10 millions means that India has to send away seven millions more of surplus exports than she would need to do in the other case?—Yes.

12,526. And the lower rate, by its action on rupee prices, is what commands the additional seven millions of exports?—That is so.

The witness withdrew.

Adjourned.

THIRTY-FIRST DAY.

Thursday, March 2nd, 1899.

PRESENT:

THE RIGHT HONOURABLE SIR HENRY H. FOWLER, G.C.S.I., M.P., in the Chair.

The LORD BALFOUR OF BURLEIGH.	Sir ALFRED DENT, K.C.M.G.
Sir FRANCIS MOWATT, K.C.B.	Mr. ROBERT CAMPBELL.
Sir CHARLES CROSTHWAITE, K.C.S.I.	Mr. F. C. LE MARCHANT.

Mr. ROBERT CHALMERS, *Secretary.*

Major Leonard Darwin.

2 March 1899.

Major LEONARD DARWIN, called and examined.

12,527. (*Chairman.*) You were formerly M.P. for the Lichfield Division of Staffordshire?—Yes.

12,528. Have you been in India?—No, I have not been in India.

12,529. We know that you have made a study of the currency question?—Yes; I have written on bimetallism, and I came to the conclusion that bimetallism would be the best currency system under certain conditions, but I do not think that those conditions are at all likely to be fulfilled for some time to come. Moreover, I do not see any greater difficulty in introducing bimetallism after a gold standard has been adopted than before, and therefore my preference for bimetallism would not lead me in any way to oppose the adoption of a gold standard in India.

12,530. You consider that we can discuss the Indian currency question outside bimetallism altogether?—I think so.

12,531. You have written also a work upon the Indian currency question?—I wrote a short pamphlet, the main object of which was to show that the re-opening of the mint to silver would be the worst possible course that could be adopted. The reasons for that view have been so fully stated that, perhaps, there is no need that I should repeat them.

12,532. We should like to have them from you shortly. First of all you were of opinion that it would be an unwise thing to reopen the mints?—Yes.

12,533. Will you tell us why?—My main reason is that it would at once reintroduce all the

evils of a shifting rate of exchange. I feel sure myself that the relative value of gold and silver will not remain stationary; sometimes you will have a falling exchange; sometimes you will have a rising exchange; you will never get fixity. Although it is possible that the evils of a fluctuating exchange have been exaggerated, yet I think they are very real and ought to be avoided if possible. That is my main reason. A second reason is that each one of the schemes for opening the mints to silver, if discussed in detail, shows its own separate disadvantage. You would have to discuss each separate scheme in detail in order to show the full objections to them.

12,534. No scheme has been proposed which to your mind would be free from vital objection?—That is so.

12,535. Are you in favour of the introduction of a gold standard into India?—Yes; I think that the present monopoly rupee system is decidedly objectionable, and I look upon a gold standard as the only alternative before us practically.

12,536. Do you accompany that opinion with a further opinion as to whether that gold standard should be accompanied or not with a gold currency?—I am coming to that point later.

12,537. Now, have you formed any opinion as to the rate of exchange?—Of course that is the very first point to be settled in dealing with a gold currency. I am in favour of a 1*s.* 4*d.* rate of exchange.

12,538. Why?—It is the rate in the market at the present moment—at least approximately the rate, and to introduce a 1*s.* 4*d.* exchange would cause the minimum of disturbance. In the second place, although I believe it is true that the Government are not definitely pledged to that rate, yet it is, I think, the only rate that has been mentioned in despatches since 1893, and therefore the public have come to regard it as the rate which the Indian Government are prepared, and intend, to adopt. I think it is almost certain that a large number of contracts have been entered into in the belief that that rate will be maintained. Therefore, unless there is some strong argument in favour of another rate, I think that rate ought to be adopted.

12,539. Do you think there would be any effect on trade if a lower rate or a higher rate were adopted?—I do not think there would be any balance of gain or loss to the community at large by adopting another rate of exchange, but I think that different classes would gain. Perhaps I could illustrate it in this way. The rate of exchange is the ratio of the purchasing power of gold to the purchasing power of the rupee. Well, the Government cannot affect the purchasing power of gold. All they can do is to affect the purchasing power of the rupee. If, for instance, they determined to introduce a 1*s.* 2*d.* rate of exchange, they would have to increase the currency and, by increasing the currency, reduce the purchasing power of the rupee. Of course the exchange is the relative price in rupees and gold of the goods which either do or can pass backwards or forwards between the two countries concerned, and, if the Government altered the rate of exchange from 1*s.* 4*d.* to 1*s.* 2*d.*, they would increase the prices in rupees of those goods in that proportion.

12,540. You mean in the foreign trade?—Yes, the goods in the foreign trade. As to the other goods, the increase in the number of rupees would affect their prices also. It does not follow that it would affect them in the same proportion, but their prices would be affected. Therefore, the increase in the number of rupees would cause a general rise in prices. It is a well-known fact that, when prices rise from causes of this sort, wages do not rise equally quickly. Therefore, you would have, from an increase in the currency, a rise of prices not at first accompanied by an equivalent rise in wages. Everybody who has had anything to do with manufacture knows that that is a very happy state of things for the manufacturer; he is certain to have his profits increased. Therefore I look upon it—it is no use blinking the fact—that lowering the rupee would stimulate production. Manufacturers see this, but I do not think they see the cause of it. I think the cause of it would be exactly similar to putting a tax on wages and salaries and fixed payments, and handing the proceeds of that tax directly into the pockets of producers and manufacturers. I believe that would stimulate trade, but, if it was seen that that was the real operation, no one would demand it. And I may add this, that it is not only those concerned in trade who would be affected in that way, but every Government *employé* and every man gaining his wages in any way would be affected.

12,541. If the raising of prices stimulated production would it also stimulate consumption?—I think it is very doubtful whether it would or not.

12,542. An increase in production without an increase in consumption does not benefit trade?—Yes; such a state of things is certain to lead to a reaction. The beneficial and the harmful results are only temporary.

12,543. Take the case of the tea trade. High prices caused over-production?—Yes, I think they did, and then there was a reaction.

12,544. Then your reason for adopting this rate is purely one of expediency?—Purely one of expediency.

12,545. No principle in it whatever?—No; I do not think you can say that there is any natural rate of exchange between the monopoly rupee and gold.

12,546. Unless you adopted the bullion value of silver?—Just so, but take any value between the bullion value of silver and 1*s.* 4*d.*, and I do not think any rate of exchange can claim any special advantage.

12,547. Assuming the rate to be what you suggest, how would you introduce the gold standard?—I think that, if no steps be taken, it is quite certain that a gold standard will be automatically established in time. Therefore, there are two policies between which the choice lies; one is what I may call the policy of drift and letting the gold standard establish itself by the process of time, and the other is the policy of taking active steps to introduce it at once. Those are the two alternatives. But, even if the policy of drift is adopted generally speaking, then some steps should certainly be taken even under that alternative.

12,548. You mean by "drift" going on as we are?—Yes, or very nearly so.

12,549. That is with the present closing of the mints to silver?—Yes.

12,550. And going as we have been going on for the last four or five years?—Yes, but I should like to make some alteration even if broadly that policy were adopted. If you look merely to the results of the different possible policies, then I have no hesitation in saying that more active steps should be taken at once; but then this is very largely a political question. If any scheme too new, novel, or bold were proposed, the whole plan might be wrecked. Now, I feel that this Committee is in a better position, if I may say so, than any other body to judge of the opposition which will be aroused by any scheme. But perhaps I may make this one remark. I think it is very probable that the Government will whittle down any proposal made by this Committee, and it is possible that the House of Commons may whittle down any proposal made by the Government. Therefore, it seems to me right to say both what is the best system that can be adopted, and also the concessions that might be made to meet the apprehensions of the public.

12,551. Will you state what you think would be the best system?—I would like to answer that question under two headings. First, the changes that I should make if what I call the policy of drift were adopted. The first thing to consider is the ebb and flow of the currency which is necessary to establish an even rate of exchange. You must have a proportion of the currency ebbing and flowing in order to maintain an even rate of exchange. If the gold flows out to India, as it is doing, I understand, at the present

Major Leonard Darwin.

2 March 1899.

moment, and if that gold passes into the currency of India, that undoubtedly will make a fluid margin which will be capable of oscillating backwards and forwards, and creating a stable rate of exchange. But, supposing that gold going out to India is used for the purchase of rupees, I take it that the gold will then pass into the Government reserves. I do not see what is to bring back that gold to England if there is an adverse international balance. If you trust to the policy of drift, then you are establishing a system by which you perpetually keep filling up the currency to the full that it is capable of holding, but you are supplying no means for certainly bringing down that currency to its old volume. In order that that result should be obtained you must make the reserve completely fluid. That is the essential thing.

12,552. The reserve of gold?—You must keep the reserve of gold, which is to help to keep the exchange steady, in a fluid condition.

12,553. (*Sir F. Mowatt.*) When you say "fluid," do you mean that it should pass into the currency?—No, I mean that it should be capable of flowing backwards and forwards between India and those countries which are trading with India and with which there is a balance of trade to be adjusted. That is what I mean.

12,554. (*Chairman.*) You mean that not only should the gold go into India as we are now assured it is doing, but that it should also flow out?—Yes, that is the essential thing.

12,555. And the ebb and flow would create the true level?—Quite so, and I do not feel sure that under the existing system it will flow out again readily because it may get caught in the Government reserves. The best expedient to adopt is, I suggest, to give the public the right of buying that gold. Of course, if the Government themselves shipped home their gold, and at the same time filled up their reserves with silver rupees and currency notes, then the Government might keep a stable rate of exchange; but I do not like trusting to the Government, and I should like to make the system automatic by giving the public the right of buying any gold that has accumulated in the Government reserves.

12,556. Is not that another way of putting the convertibility of the rupee?—It is not quite the same thing.

12,557. It is not quite; but it is a long way towards it?—Yes, it is going very much in that direction, but it is a limited convertibility because it would only act in so far as gold had accumulated.

12,558. That is to the extent of the gold that would be available for the purpose?—Yes.

12,559. I do not want to interrupt you, but you are not overlooking, are you, that the Government has to make payments to the extent of something like 17,000,000*l.* of gold every year in London?—I am not overlooking that fact. That I should prefer to be carried on very much in the same way as at present.

12,560. Now, will you go on to explain that in your own way? Have you any other suggestion to make with reference to what you call the policy of drift?—I should like to avoid having a gold currency in India.

12,561. Is that part of the policy of drift?—Yes. Even if the policy of drift is adopted, I should like to avoid having a gold currency in India, although I admit that it is a matter of quite secondary importance. If you had no gold currency in India, the gold which reaches India all flowing into the reserve, it would be far easier to keep a watch on that reserve and to tell when it was running dangerously low; and, when it was running dangerously low, steps might be taken to increase it. That is one reason why I would prefer a gold reserve rather than a gold currency. Another reason is that paper is less likely to be hoarded than gold. As I have not been in India, I can only speak with diffidence on this matter, but I suppose there is a risk of hoarding, and I would rather avoid it if possible. Lastly, I think gold in a reserve can be made more readily available for flowing abroad than if it is in currency. If the gold is in currency, up country for example, then it might require a considerable change in the rate of exchange before all that gold was dragged out of the currency. If the gold was held in a reserve, and if there was a considerable amount of money which might be exchanged for that gold, all that gold would at once be available to flow abroad in response to any change in the balance of trade. Therefore, gold in reserve is always more readily available for international purposes than gold flowing about in the currency. I mean to say that I would have gold held in reserve and the certificates, which might be exchanged for that gold, would flow about the country.

12,562. You mean paper notes?—Paper notes.

12,563. A paper currency?—A paper currency.

12,564. With gold at its back?—Quite so.

12,565. (*Sir F. Mowatt.*) When you say the public should have the right of purchasing the gold from the Government reserves, do you mean purchasing it by notes?—Purchasing it with silver rupees or currency notes.

12,566. With silver rupees?—Yes; if the policy of drift is adopted I should prefer to have that.

12,567. (*Chairman.*) Those are the suggestions that you make as to the policy of drift. Now supposing the policy of drift is not adopted, and that the Government should be of opinion that it was desirable to proceed with vigour, how would you suggest the introduction of a gold standard?—If you desire to take immediate action, which I think it is right should be done, then still I should like to take these steps to prevent gold becoming current. But that is not the most important point. The most important point is still this contraction and expansion of the currency, which I do not think will be efficiently provided for under the policy of drift. I should like to see the Government sell notes for gold at the rate of 1*s.* 4*d.* I would not put the Government under the compulsion of selling silver rupees for 1*s.* 4*d.*, because I would much sooner have the currency consist more of paper and less of silver, although it is of the greatest possible importance that there should be sufficient silver in circulation. That of course gives the expansion of the currency. Then with regard to the contraction of the currency, I should like to make the Government undertake to convert all the existing currency notes into gold on demand. If that was felt to be too rapid a change to be made all at once, then in the first instance only a proportion of them might be made convertible into gold. I would like to make these notes convertible into gold in London, but that is a point of secondary importance. The reasons why I should like to make the notes convertible into gold in London are those which have been very fully stated by Mr. Lindsay, and I do not propose to repeat them. There is one point I should like to emphasize. I take it that one of the great objects to be attained in any currency reform in India is to get a greater elasticity of the currency. Now, I think that you will get a greater elasticity of the currency if you make conversion in London. To make the currency more elastic in times of stress, it is, I think, necessary judiciously to allow the amount of notes against a given volume of gold to be increased. The amount of notes against a volume of gold must be increased in times of stress, and I think that it would be more possible to do that if the gold were held in London than if the gold were held in India. Your gold reserve in India will at first be small, and, when it is running low, greater apprehension will be felt if it is held in India than if it were held in London. That is one of my reasons for wishing to have the convertibility in London, because I think you will get greater elasticity.

12,568. Does not that practically amount to this, that your convertibity is to be confined to exchange transactions?—That would be the result aimed at. I would, in fact, propose something in the nature of Mr.

Lindsay's proposals, with modifications. The great objection that has been taken to Mr. Lindsay's proposals is that they appear artificial. I do not think that the criticism is well founded. If gold is handed in to the bank in London, and notes are handed out at another counter, nobody calls that an artificial transaction, and I think nobody calls it Government interference even if it is done at a State bank. I do not see how it makes the system any more artificial if you separate the two counters, the one at which the gold is handed in, and the other at which the note is handed out. I do not see that it makes the system any more artificial, even if you place the counter at which the notes are handed out as far away as India. My proposal simply would be that sovereigns might be handed in in England and the corresponding notes would be handed out in India. That would be the way in which the currency would be swollen. The circulation would be contracted by the note being handed in again in India, and the gold handed out in England. Then as to the question of the margins said to be necessary to give a certain play to the rate of exchange. If I may just allude to Lord Farrer's evidence given before this Committee yesterday, his Lordship thought it was necessary to have margins. That is a very complicated point, but I have thought over it carefully, and I see no advantage in having two margins as proposed by Mr. Lindsay.

12,569. What have you to say about the convertibility of the rupee?—I think, if we consider the question of the convertibility of the rupee we are on the horns of a dilemma. We must make them either convertible or not convertible, and there are objections to both plans. If you do not make them convertible into gold, there is a chance of the convertible notes going to a premium. I do not think there is any theoretical reason why they should do so, but the want of confidence in the inconvertible rupee might possibly have the effect of driving the convertible note to a premium, which would be objectionable. But there are other reasons, and perhaps stronger reasons why I should like to make the whole currency convertible.

12,570. What are they?—The first of these reasons is that it would reduce to a minimum the amount of gold necessary to maintain a stable rate of exchange, if all the money in the currency was available for conversion. For instance, if gold notes were hoarded, and if gold were set apart specially for the redemption of those gold notes in hoards, that gold would be for the time being quite useless for the purpose of adjusting the balance of trade. Gold notes may be locked up for a time without being actually hoarded. If all the gold were readily available for exchange operations, a small reserve would suffice to check oscillations in the exchange, and, if the gold can be bought with all the currency, then it would all be quickly available. There is another reason why I should like to make all the currency convertible. If you have a large mass of inconvertible currency, silver rupees or currency notes, you always run the risk of filling up the currency too full. The Government will always be under the obligation of seeing that they are not forcing too many silver rupees or too many currency notes into circulation. If they do that, they must inevitably drive the whole gold out. If you apply the safety valve of convertibility, the Government will at once have warning if they are filling up the currency too full with silver rupees and currency notes, and, therefore, in my opinion there would be an element of safety in making this complete convertibility.

12,571. (*Sir F. Mowatt.*) And you would take any premium on gold or notes as a proof that the silver currency was becoming too ample?—The proof would be, I think, that the silver rupees would be presented for exchange for gold; they would come in rapidly for exchange, and the excessive issue would show itself in that way.

12,572. (*Chairman.*) But would you make all the silver rupees convertible at once?—I should like to do so.

12,573. Would it not require a large quantity of gold?—I do not myself think it would.

12,574. Will you just tell us what your views are upon that point?—Each rupee, as it flows out of the currency, provided it is not replaced by a gold coin, must diminish the number of rupees in circulation; and when the rupees in circulation diminish, their value increases, because the demand remains the same. The value of these rupees must inevitably rise as the coins flow out of circulation. You would therefore come, and come, as I think, very quickly, to the point where it would cease to be profitable to exchange rupees for gold. If the gold does not flow into circulation to replace the silver rupees flowing out of it, there is an absolutely definite limit beyond which no rupees will be presented for conversion.

12,575. It excludes the possibility of money coming in from hoards?—That is, of course, one of the dangers that have to be considered; but I think the point to be considered with regard to convertibility, to which sufficient consideration has not yet been given is that, if you are to make rupees convertible into gold, it is absolutely essential that the gold itself shall not flow into circulation to replace the silver rupees. If gold flows into circulation to replace the silver rupees, then you may have a very considerable amount of silver rupees flowing out and demanding conversion into gold, and the liability may then become very great.

12,576. What shape is the conversion to assume? Take this illustration:—I have got 15 rupees, and I go to the Indian Treasury with my 15 rupees; am I to receive a sovereign for them?—I should prefer, as I said before, having the conversion in England; but, if you assume the conversion is to be in India, that would be the form.

12,577. Now, that sovereign coming out, does it not go into circulation?—I should endeavour to prevent the gold getting into circulation by, in the first place, preventing it from being received at any State institution.

12,578. You would not make it legal tender?—I would not make it legal tender, and I would go further; I would prevent it from being received, as I understand it is at present, in payment of taxes. I would abolish that law.

12,579. That is, you would not give 15 rupees for the sovereign?—I would give 15 rupees for the sovereign, but I would not allow any tax collector to receive that sovereign, and I would prevent it being received at any railway; and I would prevent it becoming legal tender. And I would take one more precaution in order to make gold flow out of circulation more readily than silver rupees. The Government would sell currency notes for silver rupees; they would be bound to do that; but they would have the option of charging ½ per cent. when silver rupees were presented in demand for notes. This option should only be used if gold is entering into the currency.

12,580. (*Mr. Campbell.*) Do you mean gold notes?—Yes, I would only have one class of notes.

12,581. (*Sir F. Mowatt.*) The note would be changeable for a sovereign, would it not?—Yes.

12,582. So that the two transactions would amount to this, that the person bringing the 15 rupees would buy a 1*l.* note, and he would then buy 1*l.* with his 1*l.* note?—Just so, but in the first of those transactions I would give the Government the right to charge ½ per cent. premium if silver rupees were presented, the object being to make gold flow out of circulation more readily than silver rupees. I think in that way you would make it quite certain that gold would flow out of the circulation more quickly than the silver rupees, and that is all that is required in order to make complete convertibility a safe proposal.

12,583. (*Chairman.*) Then do I quite understand your scheme to be this, that the currency in India

Major Leonard Darwin.

2 March 1899.

would remain as it is now, mainly rupee currency supplemented with convertible gold notes?—Yes.

12,584. That there would be no gold coin in circulation at all?—Yes.

12,585. But that, if anybody wished to have gold for his rupees, the first step would be to have a note, and the second step would be to turn that note into gold?—Yes.

12,586. But that note would be turned into currency, into sovereigns?—Into sovereigns, but it would not be turned into sovereigns in India.

12,587. It would be turned into bullion, the bullion assuming the shape of a sovereign which would require to be exported?—If you have the conversion in India. But I should prefer to have it in London. I have written out my scheme here.

12,588. Will you just read it to us?—Before I read it I should like to say this: As I have said, this is very largely a question of policy. The essential features, and this I want to put very strongly, are that the rupee should be at 1*s.* 4*d.*, and that a portion of the currency should be convertible into gold. Those to my mind are the really essential things, and I would give up everything else rather than sacrifice those. Thus the parts of the scheme which I would give up rather than sacrifice those essential things are, first, the convertibility in London, and, secondly, the convertibility of silver rupees. I should give up those with great regret, because I feel sure that they are right.

12,589. (*Lord Balfour of Burleigh.*) You mean those are the things you would establish?—I would give them up for fear of wrecking the whole scheme if that would be the probable result of endeavouring to carry out these proposals in their entirety. I said that the matter is largely a question of policy, and you might have to give up what was theoretically right in order to carry your proposal. I would give up first of all the convertibility in London and secondly the convertibility of silver rupees rather than run any chance of wrecking the whole scheme.

12,590. (*Sir F. Mowatt.*) Before you read your scheme let me ask you this: Taking your convertibility in London, what would happen to a man in India who wanted to convert say 15,000 rupees? How would he proceed to convert them through London?—Are they in notes?

12,591. No, I will take it in rupees?—He would first exchange those for notes. The Government would have the option of charging ½ per cent. premium, and then he would transmit those to England through a Government office. When they reached England they would be convertible into gold.

12,592. (*Chairman.*) That is really Mr. Lindsay's scheme?—Yes, I have said so. There is one other point I would mention. There is another way of meeting the objections that are raised to any scheme of this sort, and that is by limiting the amount of the liability. If the conversion were done in England, and if the conversion were undertaken by the Bank of England, it might be laid down that the Bank would not be liable for more than so many million pounds sterling, and the Government of India might limit their liability in a similar way. That is the way I should really like to meet any popular apprehension. There are two ways of meeting popular apprehension, one by abandoning the convertibility of the silver rupee and abandoning the convertibility in London, and the other is by limiting the liability, by making the Government responsible for the conversion only until a definite gold reserve is exhausted. It is the latter one of the two that I should prefer.

12,593. Then you would have to limit the notes?—I do not see that there would be any necessity to lay down a limit to the number of the notes. If it were announced that notes would be converted into gold up to a certain definite sum and not beyond that definite sum, you could in that way limit both the liability of the Government and the liability of the bank.

12,594. But suppose that more rupees were tendered for the notes?—Then the exchange would have to fall. That is the case in which you have a limited liability and the limit is exceeded; then the exchange must fall, there is no help for it.

12,595. Then you would stop the issue of notes beyond that amount?—I would stop the convertibility of the notes.

12,596. If you have notes for a million and your limit is 500,000*l.*, which notes out of the million are to be converted?—The first that are presented.

12,597. Now will you read your scheme?—"(1.) "The legal tender currency to consist of notes and "silver rupees. (2.) The Government to sell notes to "an unlimited amount at the rate of 1*s.* 4*d.* per rupee. "In England the sales to be conducted like the "existing telegraphic transfers. In India, the notes to "be sold for gold. (3.) All notes to be convertible "into gold in London at the rate of 1*s.* 4*d.* per rupee, "the Government having the right to issue regulations "as to the method of transmitting the notes from India "to England. (4.) The Government to sell notes for "silver rupees in India to an unlimited extent; but "to have the option of charging a premium of ½ per "cent. (5.) All the laws and regulations dealing with "the use of gold currency in India to be repealed. No "collector of taxes, nor any State Institution, to receive "gold from the public. (6.) The Bank of England "to undertake to cash notes sent back from India. "The Bank to receive all moneys received for the sale "of notes in England, and all gold shipped home by "the Government from India. The bank to keep such "a special reserve of gold against these notes, if any, as "may be necessary, according to regulations framed by "the Government, and to receive suitable remunera- "tion. (7.) The Government to have the power at "some future date, and with due warning, to cancel "their liability to convert notes into silver rupees. "(*Note.*) If the Bank of England should demand "remuneration at a very high rate, because of the "apparently unlimited liability, then a limit should be "placed on that liability. A definite sum (say "5,000,000*l.* at first, and increasing as time went on) "should be named beyond which the bank should not "be required to find gold in exchange for notes; and "the Government should strictly limit their liability "in a corresponding manner."

12,598. Have you any further remark you wish to make to the Committee?—I think not.

12,599. (*Lord Balfour of Burleigh*). I do not know whether I quite followed the part of the scheme which I think you foreshadowed in an answer to one of the questions earlier, viz.:—that only a proportion of the notes were to be convertible into gold. When you first mentioned it, you said a proportion of the notes were to be made convertible into gold; the next time you said a proportion of currency. You meant no difference between those two—the notes being part of the currency; is that it?—What I should like to adopt would be this scheme that I have just read, which makes a portion of the whole currency convertible; because both the notes and the silver rupees would be capable of being converted into gold until the gold in the reserve was exhausted. In the answer to which you allude, I was thinking of a possible initial stage in the introduction of the system. The first step might be to make the whole or a portion of the existing currency notes convertible into gold without making any other part of the currency convertible.

12,600. But, if only a proportion were to be convertible at the will of the holder, and that proportion were to be tendered for conversion, and the Government said, "Well we are not bound to convert any more, and we are not going to do it," surely that would prevent your keeping up the par of exchange at 1*s.* 4*d.*?—Inevitably. If there is a limit to the liability of the Government, and if that limit is reached, exchange must fall. You can only avoid the fall in the exchange under all circumstances by undertaking a nominally unlimited liability. You are on the horns of a dilemna. You must either say, "my liability is unlimited and I will prevent the exchange falling," or,

if you take a limited liability, directly the limit is reached, exchange must fall. I see no alternative.

12,601. I agree, but suppose people know that there is to be a limit; would not that tempt some people for selfish purposes to disturb the balance and bring about a fall of exchange, and so defeat the real object which you have in view of making a stable par of exchange?—I think that is one of the dangers of limited liability, but I do not see how, with any limitation of liability, you can get over that danger. However you limit it, I think you will find that that danger will come in in some form or other.

12,602. Then there is another passage in the earlier part of your evidence. You mentioned that last point two or three times, which I endeavoured to concentrate in my question, but there was another passage in your evidence which attracted my attention and which I did not fully understand. I understood you to say that notes held against gold were to be increased in time of stress. What did you mean by that?—If any system such as that which I have now proposed were adopted, I think the elasticity of the currency could be increased in some such manner, because I do not propose to have definite gold held against definite notes.

12,603. But surely the propriety of having notes is that they should be either held against gold or converted into gold on somebody's guarantee?—That is the idea in England. But we do not have a right to convert our silver currency or our copper currency. There is no right of conversion in that case; and, if you gave a right of conversion of the silver currency in England, I do not see why you would necessarily have to put aside a separate amount of gold to meet that silver and that copper currency.

12,604. This last answer has opened up rather a large question, and one which we had before us yesterday; but, obviously, if silver is not a legal tender beyond 40*s.*, it is in a wholly different position to either notes or a rupee, which is legal tender to any amount?—That is, no doubt, so.

12,605. In that case, of course, the analogy fails between the two?—It does make a considerable difference.

12,606. Now let me get back to the other point. If notes held against gold may be increased in time of stress—I presume at the will of the Government?—Yes.

12,607. Does not that put a tremendous temptation and power in the hands of the Government of really debasing the currency? Does it amount to anything less than that?—That is the danger, but I think you must face a certain danger in order to give elasticity to the currency.

12,608. But, if you contemplate the Government doing that at all, even to the extent of 100,000*l.* sterling value, is not that an improper and illicit operation?—I do not see that it is so, if it has the effect of diminishing the stringency. If you have convertibility of the coin you prevent the debasement of the rupee; no doubt, you cannot increase the currency without producing a debasement in the rupee if you increase it to an illegitimate extent; by making the rupee convertible you avoid that danger as long as any gold remains in the reserve.

12,609. You used the words "increased to an illegitimate amount." I suggest that, if notes are known to be held against gold, any increase of it beyond the amount of the gold you hold would be illegitimate?—Well, I am not prepared to agree with that view, that is all I can say.

12,610. (*Chairman.*) What you suggest is some equivalent to the suspension of the Bank Act by the Chancellor of the Exchequer?—Yes, but a more regulated operation.

12,611. If that is illegal, the Chancellor of the Exchequer's letter justifies the Bank in doing it, but only on the ground that the Chancellor of the Exchequer promises to get a Bill of Indemnity passed in the next session of Parliament?—Quite so.

12,612. (*Lord Balfour of Burleigh.*) Then I will take you upon that point. What is to be, under your proposal, the security corresponding to the fact that the Chancellor of the Exchequer has to get a Bill of Indemnity passed through Parliament?—Under my scheme you would have to trust to the Government framing suitable regulations.

12,613. We do not trust the Chancellor of the Exchequer; he has to get a Bill of Indemnity from Parliament?—Yes. I think, as far as I can judge, it is a pity that a little more trust is not placed in the Bank of England. I should be prepared to trust the Bank of England rather more.

12,614. (*Sir F. Mowatt.*) That amounts to saying that you would give the Indian Government a permanent Bill of Indemnity for the issue of notes beyond its reserve guarantee?—I should prefer to say that I think regulations might be framed for increasing the currency in times of stringency. It would be similar in its effects to a permanent Bill of Indemnity under conditions.

12,615. Now, you said that, if the *status quo* were maintained, it would lead to the gradual introduction of gold into India. What is the reason that you would give for that?—I suppose that there will be a slow diminution in the number of coins by wear and loss, and we may expect a gradual increase in the amount of business demanding an increased currency at the existing rate.

12,616. That would tend to bring the gold in?—That would tend to bring the gold in.

12,617. You said that part of your plan, if active steps were taken, was that the Government should sell gold at 1*s.* 4*d.* for notes. Did you contemplate those notes going into the reserve from which the gold had been taken or did you contemplate those notes passing into the currency?—I contemplated those notes passing into the currency reserve; or rather being cancelled.

12,618. Then the silver for those notes would go into the reserve?—I do not quite follow that point.

12,619. Somebody purchases gold at 1*s.* 4*d.*, the Government is to sell the gold at 1*s.* 4*d.*?—For rupees?

12,620. Not for rupees but for notes at 1*s.* 4*d.*, I understand?—Yes.

12,621. Then the Government has the notes and the purchaser has the gold?—Yes.

12,622. (*Sir F. Mowatt.*) The Government sells the gold?—You are talking of conversion in England.

12,623. No. Suppose it was in India. A person coming to the Government would say "I want gold "and here are my notes." The Government then has the notes and the purchaser has the gold. The notes are in a reserve. Should these notes be passed into the currency?—No. It is essential that they must be withdrawn from the currency.

12,624. (*Chairman.*) Will you just explain the two operations, the convertibility of the gold and the convertibility of the rupee?—Suppose a man has silver in India, he will have the right of going to Government and obtaining notes for that silver. The Government may charge ½ per cent. premium. Then he has his notes. Take the case that he wants to get gold. He hands those notes into some office in India. I have not gone into the exact method of transmission, but either the notes themselves or preferably some document representing those notes would be sent to England, and the holder of that document would have the right to draw sovereigns in England. The object of the ½ per cent. premium is, as I have explained, to make gold flow out of the currency in India in preference to silver rupees.

12,625. (*Mr. Campbell.*) With regard to the ebb and flow of the currency which you think would be necessary to maintain the par of 1*s.* 4*d.*, you say the gold received into the Treasury could not be shipped back to England?—I meant to have said that there seems to be no automatic arrangement for the shipping back of that gold—that we cannot be sure that it will come back.

Major Leonard Darwin.

2 March 1899.

12,626. But you said that you would give the public the right to buy the gold?—I would give that right to meet the difficulty.

12,627. How could you be sure that the public used the gold that they bought for that purpose?—You could not ensure it; all you could do would be to take the precautions I have mentioned to keep gold out of the currency by preventing its being legal tender or being received in payment of taxes, &c.

12,628. Suppose a person were to buy gold and lock it up, then the gold reserve would be wasted or applied to quite a different purpose from that for which it was intended?—No doubt.

12,629. The Chairman put a question to you as to the liability of the Government to provide 17 million sovereigns, and I think you said that you would prefer not to allow the reserve to be used for that purpose?—I do not recollect the answer to which you refer.

12,630. Why would you not allow them to use the reserve for that purpose?—If it is good business for merchants to send out gold to India, I should think it must be bad business for the Government to immediately ship it back again. If it is at once shipped back to England, whatever be the state of the balance of trade, then you will have no gold reserve in India.

12,631. I only mean their shipping it to England when they cannot sell their Council Bills at 1*s.* 4*d.*?—I should not object to their doing that, provided that the Government fill up the vacancy in the reserve with silver rupees or notes from the circulation.

12,632. I notice your statement as published in your pamphlet——?—I have simplified that a good deal.

12,633. I notice from your statement as regards the gold notes which you would issue against gold paid in in England, that the holders would not have the right to go to the Treasury Department and demand rupees for these?—I have stated in my scheme that I would allow the Government to cancel the liability to give rupees for notes at some future date. I would not cancel it immediately. Of course, Government must be exceedingly careful that there are enough silver rupees in circulation in India; that is an essential thing for the Government to look after. But I would prefer there not being a legal liability to give silver for these notes.

12,634. Then practically these notes would be inconvertible in India; they would be legal tender, but inconvertible?—Inconvertible in India, quite so.

12,635. The currency of the country, if your scheme were carried out, would consist of rupees and inconvertible gold notes?—I should not call them inconvertible, because they are convertible in England.

12,636. But a native of India could hardly use them in that way?—In that sense of the term, as you put it, they would be inconvertible.

12,637. Then do you think that the natives of India would take these notes?—I am inclined to think they would. I have got the best evidence I could—of course with difficulty—as to the using of notes in India. I believe that, with certain precautions, the use of notes may be very largely increased in India. That is the evidence I have.

12,638. But you are aware that at present the note circulation is confined to the Presidency towns and the large trade centres; notes do not circulate in the interior at all?—I am aware of that, but I think that the objections to using them could be overcome with proper precautions. I have a long letter here as to the reasons why the natives of India do not use notes.

12,639. If they do not use currency notes, which can be converted into rupees, do you think they could be got to use gold notes which were practically inconvertible altogether?—I think that steps could be taken to induce them to use notes.

12,640. Then you contemplate the possibility of these going to a premium?—No, not a greater premium than ½ per cent.

12,641. But suppose the exchange were to fall?—If the exchange falls, the whole gold currency system is a failure.

12,642. If exchange were to fall, and these gold notes went to a premium, your scheme would fail?—How could they go to a premium if they were convertible in England?

12,643. If the exchange in India fell they would go to a premium measured in rupees?—They would hardly be used at a premium in India; would they not be sent home for conversion rather than be used in India at a premium?

12,644. Certainly, but the mere fact that they were available for remittance to England would send them to a premium. Supposing exchange went to 1*s.* 3*d.*, then a gold note would be worth about 6 per cent. premium?—But would it be used in India for any payments?

12,645. Whether used or not it would be worth that in rupees?—Possibly, but the result would be that it would flow back to England and the flowing out of these notes would raise the value of the rupee and bring it back very quickly to the 1*s.* 4*d.* rate. That is the automatic arrangement for steadying the exchange.

12,646. Supposing they did go to a premium in that way by a fall in the exchange, do you think it would be a satisfactory currency to have a note circulating at one price one day and at another price another day?—I do not admit the possibility of that. I think that is the very essence of the system of a fluid margin; the notes cannot go to a premium, because if they were at a premium they would be sent home to England.

12,647. If they could be sent home at 1*s.* 4*d.*, and exchange were only 1*s.* 3*d.*, would not you, as a remitter to England, go and buy a note at 1*s.* 4*d.* and pay your 5 or 6 per cent. rather than go to a banker and pay more?—I certainly should, and notes would flow to England rapidly.

12,648. Then they would not be available for currency purposes in India at all?—Not until the premium ceased.

12,649. Is not that another objection?—No, because, if the margin is sufficient, those notes flowing home to England must inevitably raise the value of the remaining currency and at once bring it up to the old value. That is the very idea of having a fluid margin.

12,650. But until exchange rose to its old level these notes would command a premium?—I do not think that will occur any more than in the case of 5*l.* notes in this country.

12,651. With regard to the gold notes issued in exchange for rupees, would you propose to borrow in London to meet those presented for encashment?—The arrangement I should prefer, if it could be managed, would be to get the Bank of England to undertake the cashing of the notes, and to pay them a definite sum for undertaking the liability. That would, in effect, be borrowing, but it would be borrowing, as it were, by deputy.

12,652. It would be borrowing from the Bank of England instead of borrowing from the public?—It would not be strictly borrowing, because it would be paying a sum for them to undertake the liability. It would be very analogous to borrowing.

12,653. Considering the very indefinite nature of the liability, would the Bank of England be likely to undertake such a thing without at least some very large consideration?—I dealt with that point in a note to my scheme. I think it very likely they would not, and therefore it probably would be necessary to limit the liability of the Bank of England. If you limit the liability of the Bank of England, you run the risk, as you do in all limited schemes, of exchange falling. There is no escape from the dilemma. If you have unlimited liability you can keep up the exchange under all circumstances. Directly you put any limit to your liability, you must face the fact that, when that limit is reached, exchange will fall.

12,654. But is there not this objection to placing a limit on the liability, viz., that, whenever there is any indication of the liability coming near that limit, the scramble to avail of it as long as it lasted would be intense?—I think that is an objection to any limit of liability; but directly the scramble begins that scramble will have the effect of diminishing the number of coins in circulation in India, and raising the price of the rupee. It will act in both countries very rapidly.

12,655. Then, if the limit of liability were reached, and the scheme broke down in consequence, you would be saddled with whatever debt had been contracted in order to keep it up?—Yes. If you were to pay the bank so much a year for undertaking the liability, if you limit your liability, and they give gold up to the limit of their liability, your expenditure will cease. The expenditure you will have incurred in payment to the Bank of England for undertaking the liability will no doubt be gone; you cannot avoid a risk without certain expenditure.

12,656. Then practically you transfer your liability from your own shoulders to those of the Bank of England?—Only the liability to find gold at the moment it is required.

12,657. (*Sir F. Mowatt.*) Then it would be the Bank of England that would have lost the money?—Well, I am not a banker, and I find it very difficult to suggest a scheme with the Bank of England which might be acceptable. It is rather difficult for me to suggest any definite scheme. All I meant was that, on the payment of a certain sum to the Bank of England, they would undertake the liability to find the gold, on the condition that, if they gave gold for notes, we should in a certain time repay them any expenditure that they were put to.

12,658. (*Mr. Campbell.*) Then, as regards the rupees or notes received in India against these sales of gold notes, these would be locked up in the Treasury?—Yes; in the currency reserve.

12,659. And practically withdrawn from circulation?—That is the essential thing. They should be withdrawn from circulation.

12,660. What would you propose doing with them, because they would be lying idle and involve the loss of interest?—The notes would involve no interest. The silver rupees would lie idle until the silver reserve—if there was a definite reserve—had gone up to a certain point.

12,661. Would you propose melting or selling any of these rupees?—I should be very cautious about melting silver rupees, mainly because I think that the sentiment of the people would be against that. I do not think there would be any harm in melting a certain number of rupees and selling silver, provided that by so doing you did not materially reduce the price of silver. What I should do with regard to melting the rupees would be to melt them and sell them, provided there was a plethora, until the silver began to show a material sign of falling in gold price; then I would keep them in reserve.

12,662. Would it be right to say that your scheme proposes, by an artificial contraction of the currency, to maintain exchaage at 1*s.* 4*d.*?—I should not put it myself exactly in those words. We are now at 1*s.* 4*d.* If the exchange were to tend to fall, a contraction would take place, just as, if exchange falls between any other country and England, and gold flows out of England, there is a contraction in England. If you call that a contraction in England, then I say it would be a contraction in India under those circumstances. It is a matter of words.

12,663. But in the one case it would be a contraction produced by artificial means; in the case of England it would be produced by the natural influences of trade?—There I entirely disagree, if I may say so. It seems to me that one would be as natural a process as the other.

12,664. (*Mr. Le Marchant.*) Under the first system you were mentioning, which you term the policy of drift, you would propose that any gold received should be kept in India?—Yes.

12,665. You spoke of its possibly being delivered out to the public?—Yes.

12,666. Have you considered by what steps that could be done? For instance: would it be by tender, as in the case of a sale of Council Bills, or at a fixed rate?—My idea was to have it at a fixed 1*s.* 4*d.* rate, because, I think, if you depart from that rate you might at once be helping to produce the change in the rate of exchange which we want to avoid.

12,667. How would you determine the priority of applicants if the rate were fixed?—I think it would be merely a priority in time.

12,668. Are there any steps that you think would conveniently follow on upon that, moving towards a more perfect system?—What would be the next step in fact you mean?

12,669. Would you propose to move from the first system to the subsequent one which you described, with gold in London?—It is always very difficult to discuss the steps to gradually reach a perfect scheme. I should not like to say what would be my next step without further consideration. I should increase the gold held in India as a reserve by purchasing that metal when there is a surplus.

12,670. Would you regard the first scheme as consistent with the transition eventually?—Yes.

12,671. In speaking of elasticity, would you regard the notes issued under your second system—notes payable only in London—as of a character to meet the demands in the crop season in India?—I should think only partially.

12,672–3. (*Sir F. Mowatt.*) That is the excess of note issue you mean?

(*Mr. Le Marchant.*) Yes?—I should imagine that would only be partially the case at present in India, because the demand would be for an increase of silver rupees, which are not sufficiently mobile to meet the strain quickly. But from the evidence I have been able to obtain, I think that notes could be more and more introduced into the Indian system, and then the notes would more and more fulfil the requirements of elasticity. One of my reasons against melting rupees at present is that to meet that very want in the crop season I think it very desirable that for a long time to come the Government should have a very large reserve of silver rupees, which could be made available in different localities.

12,674. From what fund would these rupees be provided? For instance, I think you would require a reserve of rupees as well as a gold reserve?—No doubt.

12,675. Would you propose taking those rupees from the currency reserve?—Yes, in times of stress.

12,676. (*Sir F. Mowatt.*) You would issue into the currency again the rupees which were in the reserves when the tight time of the year began?—Yes, that would be my view.

12,677. (*Mr. Le Marchant.*) Upon the gold notes being paid into the currency reserve?—My view was that it might also be done in times of stress, very carefully and to a limited extent, without any such inflow of gold notes, in order to relieve the tension.

12,678. Would you leave that at the discretion of the Government?—Yes, I do not see any other way of doing it at present.

12,679. You mentioned that under a system of convertibility the Government would have warning if they had allowed excessive issues to be made; in what way would the Government control excessive issues? Would it not be the right of everyone to ask for notes?—If the issue were excessive, there would be a tendency for the exchange to fall, and rupees would be presented for conversion into notes, the notes being required for transmission to England. If there was too rapid a presentation of notes for transmission to England, then the Government would have warning and could take one of two steps; they could either contract their currency in

Major Leonard Darwin.

2 March 1899.

India by calling in rupees, or they could increase their gold reserve to meet the liability created in England by further borrowing.

12,680. Any material expansion of the currency in one season would be liable to be followed by a reaction?—Yes, probably it would.

12,681. You spoke of Government calling in rupees in India. In what manner would they call in rupees?—I imagine that would be possible by local borrowing in India, or, in the case of an expansion to meet exceptional stringency, the contraction would be effected by the repayment by the Banks to the Treasury, and by the Treasury to the currency reserve, of any special advances; the maximum amount of such special advances varying with the excess of the rate of discount in India over the English rate.

12,682. That might not be convenient in a season when people were anticipitating depression?—You are rather dealing with banking questions, upon which I do not profess to be in any way an expert.

12,683. But it appeared to me that the Government was being converted into a banker?—No doubt.

12,684. When you were discussing the probability of a premium upon gold notes in the event of a tendency of exchange to fall, were you alluding to gold notes with complete convertibility or limited convertibility?—I do not remember the point you are alluding to.

12,685. I think you were discussing with Mr. Campbell the question whether the notes would not go to a premium if exchange tended to fall. Were you speaking then of notes with limited convertibility, that is to say, with a limited amount convertible, or with unlimited convertibility?—I did not distinguish the two cases in my mind. As far as I can see, my answer would apply to both cases.

12,686. You mentioned, I think, that limit of convertibility might be obtained by a statement of the Government that a certain amount only of the notes in circulation would be cashed? — Either that or, I think, more conveniently, that there was only a certain amount of gold available for cashing them.

12,687. Would not that be a breach of faith with existing holders? It is not easy to draw a distinction, when notes are in circulation, between the rights of different holders?—I think if anyone drew a note, knowing these conditions, their enforcement could not be said to be a breach of faith.

12,688. It might increase the desire to cash them?—It might; but, as I said before, it is very difficult to get any form of limited liability in which you will not have that difficulty.

12,689. (*Chairman.*) The strength of the chain is to be measured by its weakest link, and the possibility which might attach, even to one note, may be taken to be the ultimate possibility of all the notes?—I think so, and it is for that reason that I prefer unlimited liability. But if it is admitted, and of this I am not certain, that notes would be reduced in value if there were not a full reserve held against them, is it not almost equivalent to admitting that, if you have gold notes and inconvertible silver rupees, there would also tend to be a difference between those two in value?

12,690. (*Mr. Le Marchant.*) If you issue notes convertible only in London, would you propose to issue no further notes of the kind now current in India?—I do not know why all notes should not be equally convertible under this system. I would not have two classes of notes.

12,691. (*Sir F. Mowatt.*) You would have them all convertible in London?—All convertible in London.

12,692. (*Mr. Le Marchant.*) At present the notes are paid in rupees. Would you still continue that facility?—I have said that I would not put the Government under the legal liability to convert notes into rupees as well as into gold; or rather, I would give the Government the power to get rid of that liability, when they felt it safe to do so. You must look to an increase of notes. If this liability is not cancelled, either you must have notes convertible both into gold and silver, when you have a double liability created; or you must have one set of notes convertible into gold and another set convertible into silver, which is to my mind objectionable, because you might have one set of notes going to a premium as compared with the other.

12,693. Speaking of the first system, have you any opinion as to the probable movement of exchange——whether the rate is likely to vary to any material extent?—My impression is that the rate of exchange will keep up to 1*s.* 4*d.*, but then that is only a prophecy, and anybody who looks to the history of currency will, I think, see that it is strewn with false prophecies. Perhaps I might give my reasons why I think it will keep up and where the danger lies. The exchange is really based upon the rupee price of the metal gold in India. We should all admit that the rupee price of tin or copper or lead will continually vary, and, as long as you have a monopoly rupee system, so long will the exchange certainly vary. Of course the rules of 1893 have a great influence on the question. The rupee will probably increase in value both because the numbers are diminishing and because of the increase of business; but what is, I think, often forgotten is that it will not be enough for the rupee to increase in value; it must increase in value quicker than gold. Now, we do not know what the future of gold is going to be. Probably it will fall in value; but that prophecy has been made for years and years, and so far it has proved false. If that should be false in the future—if the gold should increase in value and increase in value quicker than the rupee, then exchange is bound to fall. I do not myself think there is any chance of the exchange falling very greatly, but it might fall to a certain extent, and my strong feeling is that, the exchange now being at 1*s.* 4*d.*, now is the time to fix it there for ever. Such a fall as I predict as possible but not likely is one that would only last a limited time, because the increase of business and the diminution of the number of coins in India would be sure to bring the rupee back in time to 1*s.* 4*d.* Some expenditure might be necessary to keep it up to 1*s.* 4*d.* for a comparatively short period, and I do feel very strongly that that expenditure would be justified, and would be worth incurring.

12,694. You say, if I understand you rightly, that the increase of value must be quicker in the case of the rupee than in the case of gold?—Yes.

12,695. Why is that necessary; why may not they move *pari passu*?—I will say quicker or equal.

12,696. (*Sir C. Crossthwaite.*) I suppose you admit that the bulk of the currency must remain in rupees for a long time to come?—In silver rupees, I presume it must. I should only like to say on that point that, although India is a very poor country, I think there are a considerable number of rich people, and those rich people might use a fair amount of gold in currency if you allowed the currency to absorb gold.

12,697. I suppose you know that, in order to buy produce—supposing a merchant is buying produce up country in India—he will not be able to pass notes to the peasantry; they will not take them?—I know they will not take them at present; but I think, from the little evidence I have, that something might be done to make them take them.

12,698. You are not acquainted with India yourself?—No, I am not.

12,699. Suppose the bulk of the currency to be in silver rupees for a considerable time to come, it is important, is it not, to have that currency automatically increased or reduced, as the trade requires?—I think it is.

12,700. Then suppose more rupees are required, I want to understand how, under your system, those rupees are to be obtained?—They would be obtained for gold; and although, as I said, I would allow the Government to get rid of their legal liability to exchange notes for rupees, I would not do that in the immediate future until it seemed safe to do so.

12,701. So that immediately the rupees would be obtained for gold?—For gold or notes. Notes, I understand, are now convertible into rupees on demand. I would not abolish that immediately—not till it was quite safe to do so.

12,702. So that, if a man wanted rupees, he would get them, either for gold or notes?—Either for gold or notes.

12,703. Then suppose rupees became redundant through the turn in trade, they would be paid into the Treasury?—Yes.

12,704. For what? What would a man get in exchange for them?—He would get paper notes for his silver rupees; and, if he wanted to convert his paper into gold, he could do so in London, according to my scheme.

12,705. You would charge him a premium for doing that?—For converting the silver into notes, yes; the Government would have the option, not necessarily used, of charging ½ per cent.

12,706. Do you think that that would, to any appreciable extent, prevent the ready flow back of rupees into the reserve?—I should have thought not; it is a small premium, and not certainly enforced.

12,707. Then what is the object of charging the premium—merely to make a gain?—No, it is not to make a gain; it is to induce the public to present gold in preference to silver rupees.

12,708. But the case that I was putting was that, in consequence of the turn of trade, rupees were redundant. In that case it would not be the gold that was redundant, it would be the rupees that people did not want. Suppose a slack season comes, and rupees are no longer wanted. How would the charge of a small premium induce a man to pay gold, which he wants in London, into the Treasury, instead of paying rupees, which he does not want any longer in India, and cannot use in London?—If he wants to ship home gold, and he owns gold, he will not need to buy gold with rupees in India. It may be that the ½ per cent. premium is not sufficient; but, if there is a certain premium charged on the rupee, that would tend to make the gold come in first—I think your point would be met by saying that it may possibly be that the premium of ½ per cent. is not enough.

12,709. What I am putting is that, when the rupees are redundant, they should be able to go back into the reserve without any hindrance. You say you charge this premium in order to induce the gold to go back instead of rupees. What I mean is that the rupee is the thing that should come back, so that its value may be kept up?—I agree; but I want the gold to come in first of the two, and I think that, by giving the option of charging a premium, you would induce gold to come in first and silver rupees to come in afterwards.

12,710. Ultimately, under your scheme, what you are aiming at is to substitute a paper currency, to a large extent, for the rupee currency?—Quite so.

12,711. Those notes, ultimately, would not be payable in rupees at all?—No.

12,712. They would be payable in gold?—Yes.

12,713. And in London, not in India?—Just so.

12,714. So that your scheme practically tends to put an inconvertible paper currency upon India; to take out both silver and gold, and leave the people with nothing but an inconvertible paper currency—inconvertible in India?—Inconvertible in India, yes. I should like to say that, in forming my scheme, I have not looked to the very distant future; I have looked to the more immediate needs. If, after a large gold reserve had been accumulated in London, it was thought more desirable to make the convertibility in India, then it would be easy to transfer that gold reserve to India.

12,715. Do you not think that the people would look with great suspicion on a currency which was adopted with any such intention as that—to take the precious metals out of the currency?—If they have not looked with suspicion on the present scheme, which has reduced the intrinsic value of the rupee so much, I should not think they would look with any more suspicion on a scheme for a paper currency, provided that that paper currency did really keep up to its gold value.

12,716. (*Sir A. Dent.*) Part of your scheme is that the sovereign should not be legal tender to the State, the railways, or tax collectors or any Government institution?—Yes.

12,717. If that were adopted, would it not tend to discredit the sovereign throughout India?—If the term "discredit" is merely synonymous with driving it out of the circulation, I think it would, and that would be my object.

12,718. Would it not also be a great check on the importation of sovereigns by travellers and in small commercial transactions in India?—I think it would; and, as long as the convertibility is in London, I would prefer having no gold coming into India. I do not think India gains—I think India rather loses—by the importation of the precious metals.

12,719. That would be a great check upon one of the great objects the Government of India has, namely to attract gold to the country?—I should say that would be quite an erroneous object, if the convertibility were to be in London. The mere attraction of gold to a country is, as far as I can see, not the object to aim at. I do not see that a country gains any direct advantage by having gold brought to it.

12,720. (*Chairman.*) Assuming that it was possible for a system to be introduced into India exactly corresponding to the system which prevails in England, a gold standard and gold currency with a large silver token currency, practically convertible into gold when needed, should you prefer that to your scheme?—Yes, I should; but at present I think that would absorb such an amount of gold that it cannot be thought of.

12,721. I say, assuming it to be possible and practicable, that would be far better than any of these halting schemes?—Far better, though in England we use an unnecessarily large amount of gold in actual circulation. I wish to repeat that my scheme is only to tide over the difficulty for the immediate future, and is confessedly a makeshift.

The witness withdrew.

Adjourned.

THIRTY-SECOND DAY.

Thursday, 16th March 1899.

PRESENT:

THE RIGHT HON. SIR HENRY H. FOWLER, G.C.S.I., M.P., IN THE CHAIR

THE LORD BALFOUR OF BURLEIGH.
Sir FRANCIS MOWATT, K.C.B.
Sir DAVID BARBOUR, K.C.S.I.
Sir CHARLES CROSTHWAITE, K.C.S.I.
Sir ALFRED DENT, K.C.M.G.
Mr. ROBERT CAMPBELL.
Mr. W. H. HOLLAND, M.P.
Mr. F. C. LE MARCHANT.

Mr. ROBERT CHALMERS, *Secretary.*

Rt. Hon. Lord Aldenham.

16 March 1899.

THE RIGHT HON. THE LORD ALDENHAM called and examined.

12,722. (*Lord Balfour of Burleigh.*) You are, I believe, head of the firm of Messrs. Antony Gibbs and Sons, and you have been a director of the Bank of England since 1853, and were a governor of the Bank from 1875 to 1877?—Yes.

12,723. You represented along with Mr. Goschen the British Government at the International Monetary Conference in Paris in the year 1878?—Yes.

12,724. We know also that you are president of the Bimetallic League?—Yes.

12,725. Do you in any way come as representing that body?—Not at all.

12,726. Do you speak with personal knowledge of Indian trade?—Very little indeed.

12,727. Apart from that, the Committee may take it from your writings on this and kindred subjects that you have given considerable attention to the economic aspects of the questions which are before the Committee and to the general principles and facts of monetary science?—Yes.

12,728. It is based upon that experience that you come before the Committee to express your views?—Yes.

12,729. I think you were opposed, were you not, to the closing of the Indian mints in 1893?—Yes.

12,730. As a matter of policy?—Yes.

12,731. Would you like to recapitulate your reasons for that view?—Yes, I will do that as concisely as I can, but I am afraid that it will take rather longer time than the Committee would desire.

12,732. Without going into great detail, perhaps you can tell us your views generally?—I may put it in this way. India possessed an automatic standard of value in silver, the same kind of standard that England possesses in gold. It is, to my mind, a necessity of a good standard that it should be automatic, that the needs of commerce should be supplied by commerce itself. Now, in the place of that, the closing of the Indian mints substituted a managed currency. Instead of being automatic, you may say it was autocratic; the Government has under the present system, and would have under the proposed system, to settle what amount of currency is needed for the people. It should regulate itself by the needs of commerce. The currency existing in rupees is divorced from the metallic value of the rupee, and is dependent only upon the face values; it is, in fact, a forced currency—a debased currency. It is debased exactly in the same mode—I should say rather with the same result, because the *modus operandi* is different—as that by which Henry VIII. debased the currency of England in his day. He did it in a different manner. He said that a shilling weighing such and such a number of grains was the same as the shilling weighing the legal number of grains. He diminished quantity; this diminishes quality. Here the 180 grains of the rupee remain what they were, but the gold value of the grains, by the action of the Indian Government, has been altered and greatly diminished. I do not like to speak of this in the same contemptuous manner in which it has been sometimes spoken of—for example, Lord George Hamilton, on February 21, 1895, spoke of it as a "quack remedy." I do not think it was a quack remedy at all, because, in the belief of those who recommended it, it was a proper remedy. Your quack who prescribes *pilula panis* and *aquâ pura* believes, not in the goodness of his remedy, but only in the goodness of what he gets for it. But in this case one might almost recall what was said of another heroic remedy many years ago, that it was "a crime and a blunder." That it was a blunder was not at all to be wondered at, for the reasons that I shall presently give. The Committee which recommended it had unfortunately not the qualifications that a committee of that kind ought to have had. They ought to have had amongst them merchants, men of business concerned particularly with India, and concerned generally with commerce. They had none of those things. The order of reference to them was not to examine into the question, but to see how such and such a thing was to be carried out. That I think a very vicious style of reference to a Committee on such a grave subject. The present Committee has been appointed in a very different way. The present Committee contains men upon it who are thoroughly acquainted with the needs of commerce both in England and India. The order of reference here is also very much in contrast with that of the former Committee, because this Committee is desired to look into the proposals of the American Government, to look into the despatch of the Indian Government about those proposals, and to consider them, and to consider any other matters that may appear relevant and any other modification of those proposals that may seem to be germane to the matter. Now, as to India generally, it seems to me that the closing of the mints placed it as a producing and exporting country at an economic disadvantage with China and all silver using countries. As to the people of India, it inflicted a grievous wrong from a money point of view, and a very serious wrong from a political point of view, upon the natives by the divorce of the rupee from silver, and consequent loss upon their hoards and savings in uncoined silver. I do not use such a harsh word as "robbery," which is, I think, wholly inapplicable; a robber injures another for his own gain, but the Indian Government injures the native for what is ultimately its own loss. Those are the general reasons that I have to give. The Committee probably will not require me to go into any great detail.

12,733. Just let us take the terms of reference to the Herschell Commission. I do not wish to argue the matter with you, but reading them here, I see that (as I should be inclined to read it) it leaves everything open. You have, of course, studied it, and come to a different conclusion; but the words are: "I have decided to request your Lord-"ship to preside over a Committee for the purpose "of considering the proposals of the Government "of India as contained in this correspondence, and to "advise whether it is expedient that Her Majesty's "Government should allow them to be carried into "effect." Surely those words give the Committee a discretion to report for or against?—Certainly, I did not say otherwise. What I said was that they were not at liberty apparently to consider anything else but that one thing alone.

12,734. I reserve some of the arguments that you use about the disadvantage in regard to Chinese trade and the wrong done to the natives of India, and so on, because those matters will come more properly in cross-examination rather than in your examination-in-chief; but let me refer to one of the expressions that you used in the early part of your evidence. You said that by the closing of the mints the standard was made autocratic; that it was a managed standard, and that the currency was debased. Do you not give any weight to the fact that the exchange since the closing of the mints has been, if not steady, very much more steady than it was before?—You are speaking of the exchange?

12,735. Yes?—But I am speaking of the standard. I speak of the standard whatever it is, and the circulation of that standard money among the people. I am not speaking of the exchange.

12,736. Do you not think that the fact that the exchange has been steady is an advantage to be weighed to some extent against the very severe strictures that you passed upon that policy?—I do not see that the improved exchange, which would naturally follow from good times and a good amount of exports from India, really touches that question at all.

12,737. You find it, then, that the improved exchange is from good trade, and not in any way due to the closing of the mints?—No, I would not say that—certainly not, because I say the closing of the mints, which effected a contraction of the currency, would naturally affect the exchange; but it becomes a factitious exchange—practical and useful to the Government no doubt; practical and useful to those who have to bring funds from the other side to pay their engagements here.

12,738. Then may I take it in this way—this will give you an opportunity of summing up the matter. Looking at the matter, even in the light of the six years' experience gained since 1893, do you, or do you not, consider that, having regard to India as a whole, the evidence is that the legislation of 1893 has been a success?—Not a success, I should say. Perhaps I should put it in a different way—not established as a permanent success, even from a Treasury point of view.

12,739. (*Chairman.*) Do you approve of the proposals of the Indian Government to establish a gold standard?—Not at all.

12,740. Do you know what was their original proposal in 1893?—Yes.

12,741. Why do you disapprove of it?—The first reason is that it seems to me, speaking of India alone, for a population such as India contains, a silver standard and a silver currency are absolutely a necessity, and because a gold standard without a gold circulation seems to be an impossibility. I do not consider that such a thing anywhere can be said to exist.

12,742. I do not want you at the moment to complicate this with the question of currency. I want to deal with the standard. I was simply asking you whether you approved or disapproved of a gold standard?—I absolutely disapprove of it for India.

12,743. What is your reason for that?—As I have already said, a gold standard, to be a real gold standard, involves a gold circulation.

12,744. That is your reason; you have no other?—I have plenty more reasons.

12,745. Will you be good enough to give them to the Committee?—That is my reason as regards India. As regards England and commerce generally, anything that shall further diminish the stock of gold in the world is a very great misfortune.

12,746. That is, of course, a very important reason; but that is a separate and distinct reason with reference to the supply of gold in the world?—Supply and demand.

12,747. Your opinion being that it would cause a great drain on the gold resources of the world?—Yes, if it were successful.

12,748. We must assume that. A gold standard would cause a great drain on the gold supply of the world?—Yes.

12,749. Have you read Lord Rothschild's evidence?—Yes.

12,750. You do not agree with him?—Yes. He does not say that it would not cause a great drain on the gold resources of the world; what he said was that it could be provided.

12,751. He gave some very strong evidence as to the enormous quantity of gold which was being produced this year?—Yes, 60 millions.

12,752. Still, agreeing with him as to that enormous quantity, you would think that there would be difficulty?—It entirely depends upon what use has been made of that 60 millions.

12,753. Now, have you any other reason besides the deficiency of gold to meet the demand which a gold standard would create?—I think I have said quite as much as need be about that. The reasons that I have to give for it are reasons more connected with the currency; and you wish to keep that separate. I see no objection whatever to keeping them separate. I may add that it has never been actually explained what sort of gold standard it is that the Government of India wish to recommend. Certainly it is not the gold standard of England; certainly it is not the standard of France, which is not a gold standard; nor is it the standard of America, which, though by decree a gold standard, in fact is not. In fact, you come again to the question of currency and legal tender.

12,754. Do you not consider that America has a gold standard?—America has by decree. It is *called* a gold standard; but, if I can pay my debts to an unlimited extent in silver, it certainly is not a gold standard.

12,755. How about France?—I have heard a great many people in England say that France has a gold standard; but I never heard a Frenchman say so. I remember that M. Say, the French Minister of Finance, who was president of the Conference of 1878, of which I had the honour to be a member, said to us: "It has been sometimes thought that we are tending "towards a gold standard; we are not doing anything "of the kind; if we are tending to anything different "from what we have now it is to the *double étalon*, "and we expect that that will be reached so soon as "the incubus of the German silver is removed from "us." That was M. Say's opinion; of course, it is only opinion after all, but it is the opinion of a man in a position to form a good one. Again, the law of France, there is no question, makes no doubt about it whatever; the law of 1803, still in force, says that the standard of that country is the unit of five grammes of silver—called a franc.

12,756. You see no similarity between the proposals of the Government of India and the state of things in France?—None at all. There is supposed to be, but there is none.

12,757. What country would you say has a pure gold standard?—This one.

12,758. And no other?—Canada.

Rt. Hon. Lord Aldenham.

16 March 1899.

12,759. I am coming to Canada in a minute. What is the country that you think has a gold standard except England?—I know no other country than Canada. I have not in my mind, at this moment, any other country, except England, that has a pure gold standard.

12,760. What construction do you place on the statement that has been made in the course of this inquiry, that between 80 and 90 per cent. of the trade of India is with countries with a gold standard?—I know the statement has been made, but it is certainly very far from the fact, and I will say in a very few words why the statement cannot be accepted. You say 80 or 90 per cent.; however, to be accurate, we will take it as 80 per cent. But the trade of India here spoken of is the export trade. In my view we must look, not only at the export trade, but at the trade of India generally, and the export trade may be about 5 per cent. of the whole trade of India. Therefore, so far from 80 per cent. being with countries using a gold standard, it is more nearly 5 per cent.

12,761. Five per cent. of what?—Of the whole trade of India.

12,762. I am now speaking from memory, but I do not think I am very far wrong if I say that the total trade is now pretty nearly Rx. 200,000,000; and, of that, Rx. 108,000,000 are exports, and about Rx. 90,000,000 imports?—Yes.

12,763. Then where is your 5 per cent.?—I am speaking of the trade of India, you are speaking of the foreign trade of India.

12,764. That is what I am asking you about; we will come to the internal trade afterwards. Of course, I mean the foreign trade when I am talking of trade with other countries?—Trade with other countries, yes.

12,765. You say that is so?—No; I say I dare say it is so; that the trade with other countries is 80 per cent.

12,766. You said that almost the only country in the world that has a pure gold standard is Great Britain. Then, it is said that between 80 and 90 per cent. of the trade of India, which is not all with Great Britain, is with gold using countries?—Yes.

12,767. I take it the test there is that they have to pay practically on gold values?—Who have?

12,768. India has?—Very likely, just as we, if we are dealing with Venezuela, have to pay on silver value. It is quite true that, when they deal in England, they have to pay whatever will pay England.

12,769. In gold?—In gold.

12,770. Calculated on a gold basis?—I do not quite know what "calculated on a gold basis" means. What you really mean must be to pay in gold.

12,771. Let us put it in this way. Suppose that India buys from Lancashire or buys from America a certain quantity of cotton goods, on what basis will the price be calculated—on the gold value of those goods or not?—What they buy they must pay for in the money of the country from which they buy.

12,772. Then we come back to the point we started from. Out of every 100*l.* they must buy or sell nearly 90*l.* according to its gold value?—It only means that they must pay the price that the foreign nation asks, that is all. But in India itself or in whatever country it may be that deals with England, they have not to consider the gold value so much as what the gold in which they have to pay is calculated in their own currency and their own produce. That is what they have to consider.

12,773. Now you say that no country can have a gold standard without a gold currency. Will you take the case of Canada?—Canada has a gold currency.

12,774. We are told not?—No. What you were told was that there is not a gold piece to be seen in Canada, which is quite another matter. A gold currency is a currency under which debts must be discharged in gold if demanded. A gold currency does not mean that you must have in circulation two pieces of gold rubbing against one another in your pocket to wear out their edges, it means that the coins may be represented by notes, as they are in England; because you must remember the gold currency in England is a currency of metal, and of notes convertible into metal—of use for no other purpose than to save the wear and tear of the metal, except, of course, so far as regards fiduciary issues.

12,775. Have you read the evidence of Mr. Clouston, the manager of the Bank of Montreal?—I have.

12,776. At question 6778 you will see this: "At all "events you are not ignorant as to the possibility of "a country having a gold standard without a gold "currency?—I think it is the only proper currency in "the world, that is my impression. I would not say "without a gold currency, because a certain amount "is required or may be necessary to pay balances. "Our gold is only useful to us to pay our foreign "balances occasionally. In the meantime, until "exchanges can be adjusted, we keep American gold "against our foreign balances. There was a great "outcry for us this year to mint the gold that is "coming out from the Yukon in such large quantities, "supposed to be ten millions of dollars, but, as I "pointed out to the Government, the gold is really "no use to us till it passes out of the country giving "us credit balances in other countries to draw against. "The gold minted would only remain in the vaults "of the bank, so that it would be no possible good at "all." Is not that an absence of a gold currency?—Certainly not in my view. It is a confusion of the two senses of the word currency. Mr. Clouston is perfectly right; he says there is no gold circulating in the material form of coin in Canada, just as regarding the internal trade of England you may almost say there is no gold circulating in this country, because it is represented by cheques and by bank notes, all of them involving immediate return in gold. Mr. Clouston is perfectly right. I have no doubt that there is no such thing in Canada. I remember exactly what he says, and I remember also what we had before us about the monetary law of Canada at the Paris Conference of 1878.

12,777. How do you differentiate this from India; why cannot India have the same system? I understand you to say that a gold standard is impossible without a gold currency. Then I understand you to say that a gold currency does not mean the actual pieces of gold; it means something circulating whether paper or silver or anything else which represents gold?—Convertible on demand into gold.

12,778. Very well. Now what is the objection to that in India?—Because, so far as I know at present, there has been no such proposal by the Indian Government that they are to take the enormous responsibility of converting into gold on demand all the rupees existing in solution, you may call it, in possession of the population—all the rupees in hoard and in circulation.

12,779. Then your objection really comes to this, that the risk would be too great?—The risk of convertibility would be absolutely too great, and in that I think I am supported by a great many people, probably by the Indian Government themselves, and certainly by a great many of those who have given evidence before this Committee. Sir Robert Giffen, I remember, argued this point very strongly, but at questions 10,212 to 10,216 he reduces the whole thing to what I should call a *reductio ad absurdum* or rather a *reductio ad impossibile*; because he shows what the risks would really be and what the total amount of risk is that the Government would have to run—I do not mean in money, but the total amount of risk the Government would have to undertake.

12,780. I think he wound up by saying that, if convertibility could be assured, he would not object to it?—Yes, I think that is so; but I would add to his objections the consideration that, if the British Government were really to guarantee either the convertibility of the rupee or the Indian gold debt, it would surely involve the continual interference of the

British Parliament with the executive administration of Indian affairs.

12,781. Now is there any other objection that you have except the risk? What do you say about the hoarding? Do you think there is a large amount of gold hoarded in India?—I have not the least doubt of it, but I only take that from what others tell me. I am told, for instance, by Mr. Harrison, who is the only one, so far as I know, who has given a computation, not an opinion only, that there are 300 crores of uncoined silver in hoard.

12,782. At all events he is of opinion, and you are of opinion that there is a large amount of gold in hoard in India?—Gold?

12,783. Yes, I am talking of gold?—I was talking of convertibility, for which the Government itself needed to possess gold. I do not know anything about gold being hoarded, except that it has been computed by somebody or other that there are 300 millions sterling of it in hoard. As to this it may be well to bear in mind what was said by Sir David Barbour—there could not be a better judge—in his address to the Society of Arts, on the 28th of last April:—

"Some people said, if a gold standard were introduced, enormous quantities of gold would be brought out from hoards of private persons and used as a circulating medium. He wished to speak with consideration of his opponents, but, if anybody made a statement of that sort, in his opinion he was not merely incorrect, but a man whose opinion you had better avoid taking on anything in connection with the currency. If a silver standard were introduced into this country, would the people who had silver teapots and other articles of plate melt them down and throw them into the circulation? The thing was absurd. Of course, they did not know much about Indian ladies, who usually lived in the seclusion of the zenana, but he believed they had as much influence in families as the ladies in this country, which was saying a great deal, and, if an Indian went to his wife and told her that the Government had made gold a legal tender, that he proposed to melt down her gold bracelets, and put them into circulation, he did not think he would meet with a very favourable reception. What might be expected to happen and what would happen, when gold began to circulate as a portion of the Indian currency, would be that there would be a greater tendency to withdraw it and hoard it."

12,784. The evidence before us as near as we can tell is that there is Rx. 120,000,000 now in circulation—the silver currency in India represents that?—In circulation, I agree.

12,785. And nobody knows what the amount is that is hoarded?—Quite so, but you are speaking of silver now.

12,786. I am talking of silver. With reference to the silver currency, the opinion of Mr. Harrison and other competent persons is that the amount in circulation is about Rx. 120,000,000; then there are also the hoards and the ornaments?—Yes, I should say so, generally.

12,787. Taking the experience of the past famine and various other tests which have been applied by different authorities, they seem to have arrived at the conclusion that the amount of hoarded rupees has been exaggerated?—I am quite incapable of pronouncing upon that at all, but let me say that the testimony of Mr. Harrison gives some basis, I think. He has to take an unknown quantity, x, for the amount that originally was at any definite time in India; then he takes the import of the silver and the export, and the melting down into ornaments, and he puts the figure at 300 crores. Sir Antony MacDonnell says there is three times as much in coined silver as there is in uncoined; that is, that three-fourths of the whole quantity is in rupees. It makes a very enormous sum if Mr. Harrison and Sir Antony are both right. I cannot pronounce upon that, and I believe nobody can, for the reasons that you have given.

12,788–9. Before we leave this question, I want to ask you one other question. What differentiates England and India with respect to the convertibility of their silver currency? We have a silver currency here which is not convertible?—We have certain notes printed upon silver for a twentieth part of a sovereign, which are not convertible, and which are not legal tender.

12,790. Not legal tender beyond 40*s.*?—Well, that is not legal tender practically. Nobody ever pays 40*s.* in silver that I know of.

12,791. And yet for all practical purposes a shilling is the twentieth part of a sovereign?—It serves the purpose well; nobody cares what it is worth.

12,792. And there is no responsibility on the Government in respect of that silver currency?—None at all. You mean to say there is no responsibility for conversion?

12,793. Yes?—None at all.

12,794. The Government controls the amount that is in circulation?—The Government, you may say—it is the Bank of England.

12,795. The Master of the Mint, who is the Chancellor of the Exchequer, controls it; the Master of the Mint looks to the Bank of England to say what should be put into circulation, and that is done?—Yes.

12,796. That is merely machinery?—That is merely machinery.

12,797. The ultimate authority which settles the amount of the silver currency of this country is the Government of the day?—Yes, in a manner, and to this extent: a Government of a past day has settled the silver currency, but no Government has any real influence on the amount issued.

12,798. The Government of the day acts through the machinery of the Bank of England—or is advised, if you like, by the Bank of England; but, at any rate, nobody has a right to take a bar of silver to the Bank of England and have it coined?—Just so, as to the public right; but I think I had better inform the Committee as to what the practice with regard to our token currency really is. Whatever may be the theory, the fact is that the orders for its coinage, or for treating it when "worn," do not emanate from the Government, or from that member of it who is Master of the Mint. The Bank of England is the Administrator of the silver coinage, being guided solely by the demand, and having no need to ask permission of any one. If the needs of trade, shown by the applications of other bankers, require more silver than they have, the bank supplies them from existing stock in the banks; or, if there is none but garbled silver only, that is sent into the mint for recoinage and paid for by the mint authorities; or, if there is none at all, the bank sends a requisition to the Mint for new coin, the Mint buying the bar silver in the market, and the bank paying the face value of the coins supplied. Thus, the token coinage of England and Wales is in no sense a "managed" currency, as the Indian rupee coinage is since June 1893. It is really automatic, regulated by the wants of trade, but administered (as the gold coinage also is in practice) by the bank. As a matter of finance, the whole operation is for account of the Government, and the Exchequer makes the profit. Thus a large profit accrued to it in 1889, when Mr. Goschen caused the dockyard wages (when under 2*l.*) to be paid in silver. But the business followed the usual course—the dock authorities applied to their bankers; the bankers applied to the Bank of England; the Bank of England (as new coin was wanted) applied to the Mint; and the Mint supplied the coin. So also, when there was a scarcity of silver coin in the provinces, caused by the reluctance of the country bankers to pay the cost of transit from the bank, the Government (in May 1889) agreed to bear the charge, and instructed the bank accordingly. There has been redundance also—real redundance, not the so-called redundance of Indian dispatches—more silver being out than trade needed. When that was the case, as it could not be exported, it had to

Rt. Hon. Lord Aldenham.

16 March 1899.

accumulate in the bank until, as above described, it could find its way out again. Thus in 1896–7, we held 2,000,000*l.*; and now, trade improving and using more, 1,600,000*l.* Let me correct two errors, one of which, at least, has been made before this Committee. There is no convertibility. We always do what we can to give gold coin for silver coin and silver coin for gold coin to applicants; but the public has no legal right to demand it, and the bank makes a charge of so much per 100*l.* for any large sum of silver paid in. It is altogether a mistake to say that our silver coins are saved from going to a discount by the issue being limited. Whereas, on the one hand, it is scarcely possible to issue a shilling more than the public at the moment needs, on the other hand, there is absolutely no limit to the issue so far as the public needs it. When it no longer needs it, and it becomes redundant by the falling off of trade, it is buried in the appropriate vault, as I have said before, and awaits resurrection. It is the limit of legal tender which is the safeguard, and obviously renders depreciation impossible.

12,799. Then, in England, we have a silver currency up to 40*s.*; and for all practical purposes of everyday life we have a gold standard? — And currency.

12,800. And a gold currency also. Now, would you just tell us where you draw the broad line of distinction between England and India with regard to that?—The silver currency of India is full legal tender, and practically the standard of the country. The English silver currency, which, as I say, are mere inconvertible notes, are not the standard of the country any more than the bank-note is the standard itself.

12,801. Then your point is the tender limit?—Yes, certainly unlimited legal tender makes it money; limited legal tender makes it a substitute for money.

12,802. Then the great bulk of the transactions in India—I think one-half of them—are in copper. I am talking of the internal trade?—Yes.

12,803. And there is a remaining very large proportion in silver?—Yes.

12,804. Except the foreign trade, there would be very few transactions in India of amounts requiring the use of gold?—Very few indeed, I should think.

12,805. Does that remove the difficulties from your mind as to a gold standard?—It seems to me to add to them.

12,806. Will you tell me how?—I fail to follow that. Because gold is not wanted and is not used, therefore, as I understand you to say, you think gold would be a good standard for India. I think quite the contrary.

12,807. You say that a gold currency is inseparable from a gold standard?—Certainly.

12,808. A gold currency would be wanted for a very small amount in India; at least I am putting that to you; I am not expressing my own opinion, I am putting that to you as a hypothesis?—I understand; but I should put the matter differently. In saying that a gold currency is inseparable from a gold standard, what I mean is that that which has not a gold currency is not a gold standard. That is quite a different proposition. I do not mean to say that when you have a gold standard—what you call a gold standard—that necessarily involves the use of gold in great quantities; but I say that it is not a gold standard, if a man can pay his debts in any quantity of silver. You might just as well call it a platinum standard, or anything else.

12,809. What standard is existing in India at this moment? You have not an unlimited coinage of silver?—I have given my explanation of that. There is no standard in India but a debased standard.

12,810. You think there is none?—It is debased. There is a currency which serves in a manner as the standard of India.

12,811. Now, let us come to the point as to the negotiations with the United States and France?—But first let me say that the real objection to the nominal gold standard, or to any gold standard, is the effect on the people.

12,812. The people of India?—Partly, and on the people of England in other respects.

12,813. Will you say what you have to say upon those points?—There is the matter of the mode of carrying out the gold standard, which has also to be considered. I have spoken very strongly about what I call a debased standard—debased in a different way from the debasement of diminishing the number of grains. The proposal that rupees should be melted down seems to me to be contrary to all monetary principles. When the money of a country is redundant—I mean when it is really redundant—not redundant in the sense of the despatch of Sir James Westland, but really redundant—the remedy for that is the export of that money in course of trade when the time comes. All along specie may be exported; but the ultimate result resolves itself into an export of money in payment of the balance of trade. Now, what the Government propose to do, if money is as they think redundant, is to melt down the rupee, which is a very different thing from the exporting of rupees. When you export rupees, and the tide turns, the rupees come back again. When the rupee is melted, and you have no open mint to which you can take them, the currency is permanently contracted, with the view, no doubt, in this instance, as they say, to bring in gold instead. If the gold is inconvenient, if the gold is not as convenient as the other, that is an interference with the natural flow of money to and fro, which seems to me to be very objectionable. The silver circulation, for example, necessary for the removal of crops, is diminished; and that would seem to be a very bad thing for the people. It would cause great dissatisfaction, perhaps ultimately disaffection, and that would be a very bad thing in any case. Further, it depresses the gold value of silver. If you have a quantity of coin taken away from the world and melted down and thrown on the market, it depresses the gold value of silver, and increases the economic advantage of silver standard competitors with India. Then, suppose the Government should acquire gold by loan, which is the proposal of the Indian Government, or by melting down rupees and selling the bullion, they necessarily must keep that locked up in the Treasury, I imagine, except so far as they want it to fill the void made by the movement of the rupee, if it serves to fill that void. Then, if they do that, they have not got it in the Treasury to serve towards convertibility, if that should be considered necessary. Then, again, private capital can only be attracted by the prospect of profits. Under a gold system traders know, and have said before this Committee, I suppose, —certainly they have said it outside—that India would be handicapped economically, and private capital, therefore, would not be attracted; whereas, as population increases, it is to be hoped that trade would increase and would want more circulation. I know that Lord Rothschild, Sir John Lubbock, and Mr. Lindsay, and others have given evidence against the Indian Government plan, and, on the other hand, Sir James Westland gave some very good reasons against Mr. Lindsay's plan.

12,814. What plan would you recommend?—I am coming to my plan.

12,815. (*Sir F. Mowatt.*) I understand you to adopt Sir James Westland's criticism on the Lindsay scheme?—Yes, generally; and I should like to say this about the Lindsay scheme. As a quondam governor of the Bank of England I know how that would work. I do not quite understand Mr. Lindsay's scheme. I imagined that I did, but different witnesses have given different interpretations of it. Mr. Lindsay's words are "open a current account with the Bank of "England." Now, to open a current account with the Bank of England would merely mean that the account of the Indian Council would be enhanced by five millions or whatever it might be, to which the Bank of England could make no objection whatever. But there would be no ear-marking—such a deposit

would stand in no different position from any other account that they now have with the bank, or any other account that I have or anybody else. They take their chance. But there is yet another suggestion, and that is that the Government of England should come to the rescue and should guarantee the convertibility, and Lord Farrer suggests that the Bank of England would be very willing to do that just as it really guarantees or provides for the bank note. To that I reply, Lord Farrer has never been a governor of the Bank of England or he would not suggest such a thing; it is absolutely impossible. Neither has he given real consideration to the matter of the Government taking such a risk. To guarantee that a certain commodity—for silver is a commodity in England—should be always taken in exchange for gold is a responsibility which I suspect the Government would not take. They would have in exchange for their gold only an accumulating mass of rupees, which they could not re-convert into gold *so as to supply an immediate demand*, nor at all, except by sending it to India, and awaiting a remittance of gold from the Indian Treasury—if it happened to be there. For what purpose would the silver serve? Neither the bank nor the guaranteeing Government can pay their debts with silver. Then again, if Lord Farrer is thinking of a deposit of gold bullion, of course the Bank of England would take a deposit of gold just the same as it would take a service of plate or anything else, and place it in its vaults, but that is exactly the same as if it were in Calcutta. It could by no possibility form part of our reserve.

12,816. (*Chairman.*) However, after all, we are a very long way off that?—Oh, yes.

12,817. If Parliament finally accepted any scheme the details could be easily adjusted?—Could be adjusted.

12,818. As I understand, you disapprove of the Government of India's proposals, especially on the ground of the mode in which they deal with what they call redundant currency?—Yes, on that and other grounds.

12,819. And you disapprove of Mr. Lindsay's proposals on the same ground as Sir James Westland does?—Chiefly. Partly that and partly because what you call the details——

12,820. The details would not work out?—So far are they from working out that they affect the principle.

12,821. Now will you proceed?—There is one point that has often been insisted upon and which you, Sir Henry, did in a manner insist upon, with regard to the supposed analogy between France and India in respect of the silver currency. In France they have what some people call a token currency, but which is not a token currency, of course—an inferior currency, I should call it—it is not a token, because a franc cannot be a token of a franc which is what the real monetary unit is; but the great difference between them is that India is a debtor country, and France is a creditor country. France does not need a balance to export. India does need a balance to export. Let me put it in this way:—Is India a creditor or a debtor country; that is to say, does the money value of her export, of whatever kind, to the rest of the world, exceed or fall short of her imports? Suppose, for the sake of simplicity, that her relations were only with England; are the commodities which she sends us greater or less in annual money value than the commodities and services which we send or have rendered to her? It is wholly immaterial to inquire what the commodities are which we send or what the services (represented by home charges) were and are. We send her yarns and metals (silver and iron and gold) and other things. It matters not for the present question what she does with them. She may coin her silver or use it as money uncoined, or she may make it into bangles or bury it in the earth. The money value of all together is the only thing that touches our question. Now it is of secondary importance to inquire whether the operations are wholly or only partly in trade operations. It is very useful to know the balance of trade, but it is the balance of indebtedness, as Mr. Goschen demonstrated long ago, with which we are here concerned, and that necessarily includes services and the debts incurred for them, as well as commodities. Thus, even though her export of commodities exceeded her imports by 10,000,000*l.* a year, yet India would be a debtor nation; for she owes and has to pay some 17,000,000*l.* for Government Home Charges, leaving her debtor for 7,000,000*l.* a year besides the interest and returns on private investment in India, which may be taken to be 7,000,000*l.* to 10,000,000*l.* per annum more. To show the actual surplus export of commodities I produce the following table:—

Year	Net Export of Commodities.	Average Rate of Council Bills.	Sterling.
	Rx.	*s.* *d.*	£
1873–74 - -	17,297,719	1 10½	16,000,000
1897–98 - -	10,618,894	1 3·407	6,858,035
1896–97 - -	19,733,091	1 2·451	11,839,848
1895–96 - -	32,289,810	1 1½	18,000,000
1894–95 - -	34,000,000	1 1	18,400,000
1893–94 - -	15,000,000	1 2½	9,000,000
1892–93 - -	30,000,000	1 3	18,750,000
1891–92 - -	27,000,000	—	18,890,000
1890–91 - -	8,500,000	1 6	6,375,000
1889–90 - -	19,000,000	1 4½	13,000,000
1888–89 - -	15,000,000	1 4½	10,250,000
			£131,362,883
	Average of 10 years -		£13,136,288

Against the average for the same period if home expenditure (chargeable to revenue) of 15,684,083*l.*

In the above table I have not taken into account enfaced rupee paper, which, as enfaced to England or re-enfaced to India, forms an addition to exports from India and imports into India respectively. Incorporating with the above these exports and imports, as shown in the following table, the average balance in favour of India is increased by R1,42,14,150.

ENFACED RUPEE PAPER.

Year.	Balance Re-enfaced to India = Imports into India.	Balance Enfaced to England = Exports from India.
	Rs.	Rs.
1888–89 - -	—	74,80,000
1889–90 - -	—	77,99,600
1890–91 - -	—	5,23,72,500
1891–92 - -	—	77,15,460
1892–93 - -	1,57,19,800	—
1893–94 - -	1,76,83,200	—
1894–95 - -	53,95,750	—
1895–96 - -	—	1,72,47,860
1896–97 - -	1,28,40,900	—
1897–98 - -	2,67,61,620	—
	7,84,01,270	9,26,15,420

12,822. Your point as to the supposed analogy between India and France is this: Suppose a system were introduced into India in some respects corresponding to the system which prevails in France, the difference between the two countries is that the one is a debtor country and the other is a creditor country?—Exactly. I should say generally that all managed schemes are bad. Anything that does not leave the currency of a country to work automatically on the standard metal of the country is unwholesome and ultimately bad for the country itself, whatever advantage it may give for the moment.

12,823. And, I suppose, in connection with that, you would share the opinion that has been expressed that the currency of a country should as far as possible

Rt. Hon. Lord Aldenham.

16 March 1899.

be totally independent of the Government?—I can hardly say totally independent, when I know that we are acting under the law of 1844, and that no currency at all can be independent of the Government, because it must be the Government or the nation that has to choose at some time or other what the measure of value shall be; as, for example, in England the Government has said what the sovereign shall be; but the working of the currency should be independent.

12,824. That is the word I should have put in. The working of the currency should be independent of the Government?—Exactly.

12,825. Of course, the Government must legislate?—Certainly.

12,826. But the working of the currency should not be controlled by the Government?—Just so. And I may say this: the Act of 1844 limited the powers of the Bank of England. Before that, the Bank could issue any amount of notes on anything they pleased; the Act limited that to a certain amount. No doubt the Government must legislate, but I should put it that the daily working of the currency ought to be independent of the Government.

12,827. The Act of 1844 provides that the Bank of England shall not issue paper money unless it has something against it?—Yes, with the exception prescribed.

12,828. Except as to the Government debt?—Partly that, and partly, as to the fiduciary issue, on securities.

12,829. Now, have you any other objection to the proposal of a gold standard for India?—It would increase the injustice inflicted upon the natives by the depreciation of their uncoined silver hoards through the closing of the mints in 1893. A great deal has been said upon this point, and by people whose opinions ought to be considered. Lord Northbrook, for instance, whose evidence was very interesting indeed, said he thought that practically there was no injustice at all. One reason which has been given for that opinion was that the natives did not know it. I thought that a very bad reason. I remember a member of the then Government saying to me, in 1893, "Oh, they will never find it out"; and I said "You may depend upon it, some enemy of the British "Raj will be certain to tell them about it." I told this story in 1897 to a member of the present Government, and his answer was, "They *have* found it out." But, even if they had not, it is to my mind no sufficient argument to say that an injustice has not been done because it has not been found out. Louis XIV. used to say that he was *super grammaticam;* but the Indian Government is not *super arithmeticam.* If a man could take out of his hoards 180 grains of silver and at his own pleasure get a rupee for it, whereas he has now to take 258 grains, there can be no question but that he has suffered an injustice. But it has been urged on the other side that prices have fallen; I think that point has been advanced by Lord Farrer. Now, suppose a depositor in the Savings Bank here were told, "Prices have fallen enormously in England, "and therefore, instead of giving you the whole of "your capital, we will give you 60 per cent. of it"; that would be an injustice, and none the less an injustice because it might be argued that the depositor would not feel it. It is that sort of injustice that is inflicted on the natives of India, and, once that is brought clearly before them, it is inevitable that it must produce dissatisfaction, perhaps something worse. I do not know anything about India, but I am told that this matter has come before the natives. One of the witnesses before this Committee, Mr. Barclay, I think it was, gave evidence as to that, and showed that the native press had taken the matter up.

12,830. You think it would be unjust to the natives of India as depreciating the value of their hoards?—Certainly.

12,831. And you do not attach any importance to the statement that they are ignorant in the matter, or that the action of the Government has really very much increased the value of the rupee since 1893?—No. That is the only other thing I have to say on that matter. I do not see that the action of the Government has increased the value of the rupee. Prices have not altered very much in India. It has made a difference in the gold value of the rupee, but I do not see that that affects the common people in India except in the most indirect and distant way, and a way which they can never understand or appreciate. Then, it is said that the native princes have been compensated for the loss on their silver by the non-depreciation of rupee paper; but to establish this, let us suppose that their hoarding in rupee paper was equal to their hoarding of silver; and then it must be shown—and it has not been shown—that the gain by the arrest of *further* depreciation of, we will say, Rs.100 in paper, was sufficient to make up for the loss on 18,000 grains (weight of Rs.100) of silver. Then another thing has been said. It has been proposed to raise loans here in England, and it has been urged that that would be a heavy strain on the Bank of England. I do not think anything of that at all. The Bank of England will find anything you happen to want; but, at whose cost? If there be any great drain on the Bank of England, it must necessarily be at the cost of the discount other people have to pay, and, perhaps, of a check to their power of obtaining accommodation. *They* suffer if the Bank does not.

12,832. How about the payment of taxes by the people of India; their taxes are paid in rupees, and the taxes are increased or decreased according to the gold value of the rupee?—According to the gold value of the rupee, so far as regards the amount that has to be remitted to England to pay debt.

12,833. A large number of witnesses say that it would be necessary, if the rupee went down to its bullion value, to increase the taxation of India, and that it would not be safe either politically or on other grounds to increase the taxation of India?—You are much better judges of that than I can possibly be.

12,834. But I should like to hear what you think of that argument?—I think it bases itself, to begin with, on a certainty which does not exist of the amount of the fall that there would be in the rupee. It takes no account of what would happen if the mints were opened—the good that would result, to be set against any evil that would come. And, as to the increase of taxation, you have, as I have already said, taxed the people without their knowing it, and you would have to tax them with their knowing it, where you could.

12,835. Have you read Sir Anthony MacDonnell's evidence?—Yes.

12,836. At Question 5781 he says this: "You think that, if the rate of exchange were lowered to the bullion value of the rupee, that would involve such discontent as would amount to a grave political danger?—I do not think it would be possible. You could not do it without increasing the army and the police, and taking compulsory measures." Do you agree with that?—I think that argument fails, inasmuch as Sir Antony treats as a matter of certainty the extent of the fall in the bullion value of the rupee.

12,837. I do not know what the Indian Government are going to do; we shall have their budget in a few days; but at all events, owing to the work of the system of 1893, which has kept up exchange to 1*s.* 4*d.*, there will probably be so large a surplus that, if they thought it wise, it would be possible for the Government of India to make a considerable reduction in taxation?—It would be a good thing; but I remember that, when the rupee went down even to 1*s.* 1*d.*, the Government still had a surplus.

12,838. You desire to say something with reference to the question that has been raised as to the amount of gold available?—The Committee have heard a great deal about the unlimited supplies of gold. On this subject I would like to refer to a paper communicated to the Manchester Literary and Philosophical Society last year by Professor Suess, of Vienna, who is the greatest authority on the geological distribution of the precious metals. I have endeavoured

to condense the paper, but it is so absolutely full of matter germane to this enquiry, that I have thought it better to put it in *in extenso* as an Appendix.

12,839. Now will you tell us what you have to say as to the closing in 1897 of the negotiations with the Governments of the United States and France?—I regret very much that the negotiations of 1897 were summarily closed. I had a great deal to do with the *pourparlers* in the matter. Sir Michael Hicks-Beach asked the opinion of the Governors of the Bank and myself with two other ex-Governors. I thought that the negotiations should have been kept on foot. I do not say that the negotiations should have resulted in the immediate adoption of those measures, for two reasons. One was the French suggestion of a sort of Sherman Act for England, which I thought would be a very foolish and futile thing; that would have to be rejected. The other was that one could not fail to appreciate the enormous wrench which would take place if the ratio were suddenly moved up to its old position of 15½ to 1. I had no doubt that that would be a very serious difficulty, though, when that difficulty was once got over, when the battle that it would cause was over, and the wounds cured, it would be in some measure as it was before 1873. I may mention here that a man who was one of our principal China merchants wrote to me and said: "I hope that whatever happens they will not take 15½ to 1; it will be a most dreadful thing; it will subject us to all manner of losses on existing contracts"; and he gave me his reasons. I was going to answer this correspondent, and point out that it was not at all for me to say what the decision would be, when I had another letter from him, saying, "I confirm all I said before, but still I would like even the 15½ to 1; I prefer to incur the loss for the sake of the settlement; the settlement would be a bad settlement, but still it would be a settlement." That was his view. Then, one of the ministers wrote to me and said, "We feel sure that no modifications of the proposals would be admitted, and therefore we have not re-opened the matter; we are certain it could not be done." I at that moment felt sure that the negotiations would not have been in vain; but the mischief had been accomplished, the edict had gone forth, and so it was settled. The proposal that has been made for renewing those negotiations has been approved by anticipation, and in general terms, by a despatch of the Indian Government, dated the 16th September, 1897. They say on page 13 of the correspondence:—

"It seems to us that the difficulty of making the arrangement effective will be immensely increased by the adoption of a ratio differing so widely from the present market ratio. Indeed, even if it could be maintained successfully, we should object to that ratio in the interests of India, and we recommend that your Lordship should, on behalf of India, decline to participate in, or do anything to encourage, the formation of a union based on that ratio."

* * * * * * *

"In any case, we are of opinion that the true interests of India demand that any measures for attaining stability in the rate of exchange between gold and silver should be based upon a rate not greatly differing from 16*d.* the rupee."

* * * * * * *

"For these reasons therefore, in addition to those set forth in the earlier portion of this despatch, we recommend that the reply to the request of the Governments of France and the United States should be in the negative. We presume that a union based upon a ratio low enough to suit our interests would be unacceptable to France and the United States."

12,840. You think the decision arrived at in 1897 in reference to those proposals was an unwise one?—The refusal of the proposals in their then form was inevitable, but it is a misfortune that the negotiations were not continued; the negotiations ought to have been continued.

12,841. Have you any reason to think that there is any probability of those negotiations being reopened?—Yes, I want here to refer to the Report of the Gold and Silver Commission, which stated unanimously in Part I., Sections 192 and 193, as follows:—

"Sec. 192.—These considerations seem to suggest the existence of some steadying influence in former periods, which has now been removed, and which has left the silver market subject to the free influence of causes the full effect of which was previously kept in check. The question, therefore, forces itself upon us: Is there any other circumstance calculated to affect the relation of silver to gold which distinguishes the latter period from the earlier?

"Now, undoubtedly the date which forms the dividing line between an epoch of approximate fixity in the relative value of gold and silver and one of marked instability, is the year when the Bimetallic system which had previously been in force in the Latin Union ceased to be in full operation; and we are irresistibly led to the conclusion that the operation of that system, established as it was in countries the population and commerce of which were considerable, exerted a material influence upon the relative value of the two metals.

"So long as that system was in force we think that, notwithstanding the changes in the production and the use of the precious metals, it kept the market price of silver approximately steady at the ratio fixed by law between them, namely, 15½ to 1.

"Sec. 193.—Nor does it appear to us, *à priori*, unreasonable to suppose that the existence in the Latin Union of a Bimetallic system with a ratio of 15½ to 1 fixed between the two metals, should have been capable of keeping the market price of silver steady at, approximately, that ratio.

"The view that it could only affect the market price to the extent to which there was a demand for it for currency purposes in the Latin Union, or to which it was actually taken to the mints of those countries, is, we think, fallacious.

"The fact that the owner of silver could, in the last resort, take it to those mints and have it converted into coin which would purchase commodities at the ratio of 15½ of silver to one of gold, would, in our opinion, be likely to affect the price of silver in the market generally, whoever the purchaser, and for whatever country it was destined. It would enable the seller to stand out for a price approximating to the legal ratio, and would tend to keep the market steady at about that point."

And in Part II. of the same Report (Sections 107 and 136), signed by Lord Farrer and five other members of the Committee:—

"Par. 107.—We think that in any conditions fairly to be contemplated in the future, so far as we can forecast them from the experience of the past, a stable ratio might be maintained if the nations we have alluded to were to accept and strictly adhere to Bimetallism, at the suggested (that is the market) ratio. We think that if, in all these countries, gold and silver could be freely coined, and thus become exchangeable against commodities at a fixed ratio, the market value of silver, as measured by gold, would conform to that ratio, and not vary to any material extent.

"We need not enter upon a detailed explanation of our reasons for entertaining this view, since they will be gathered from what we have already stated when discussing the causes of the divergence in the relative value of the two metals, and will be seen to result, in our judgment, as well from *à priori* reasoning as from the experience of the last half century."

"Par. 136.—It is worthy of consideration whether foreign Governments might not be approached with a view to ascertain whether they would open their mints to a greater extent than at present to the coinage of silver, for a given term of years, on an undertaking from India that she would not close her mints during

Rt. Hon. Lord Aldenham.

16 March 1899.

the same period. In order to assist such an arrangement, we think that part of the bullion in the Issue Department of the Bank of England might be held in silver, as permitted by the Bank Act of 1844.

"We are aware that a similar suggestion, made in 1881, was not acccpted, but the possibility that India may follow the example of the Latin Union in closing her mints, may render the countries forming that combination more disposed to entertain the proposal."

What they say as to the effect of concurrent mintage of gold and silver has never been seriously contested, unless, indeed, an opposite view has been advanced before this Committee; you may have had some rebutting evidence.

12,842. You, I think, hold that sufficient time has not yet elapsed to afford a satisfactory test of the success of the experiment begun in 1893?—I do not consider that the circumstances attending the experiment yet justify a definite conclusion as to its success, or justify the inauguration of a fresh experiment with a totally new system. The principal advantage of abstaining from a fresh experiment would be that time would thus be given for the British Government to ascertain by negotiations with the United States Government the possibility of arrangements being made under which the Indian mints could be re-opened to silver under circumstances which the Government of India have, indicated as safe and satisfactory.

12,843. You appear rather to favour a fixed par of exchange of 1*s.* 4*d.* if it could be effected on your lines?—For the present stress; I mean, I think that is what is practicable.

12,844. That is about 22½ to 1?—It is 22 to 1. One of the chief reasons why I should prefer to have the matter settled now, is that I think there is really a possibility that the American Government some of these days—not the present Government, but the Government of some future day—may take the bit between their teeth and re-enact their old ratio; and I think taking 16 to 1 (whether it be 15½ or 16 is of no importance) would be a fearful thing for the moment. Of course, if they did that, they would do it irrespective of the interests of India or England or anything else; they would, as I have put it, be simply taking the bit between their teeth. For this reason I very much desire that the thing should be settled by negotiation in which we should have a voice. I think also that France, as well as the United States, should come in, but that is rather a matter for the consideration of the United States. The negotiation before was conducted with both nations, the United States taking the initiative. The negotiation might be opened up with them alone. I have reason to believe that the present United States Government would not do it without consultation, but I do think they would be disposed to adopt it.

12,845. To adopt the 22 to 1, do you mean?—Yes, I believe they would, and I will give you my reason presently for saying that. When Colonel Hay was here as ambassador, I had a good deal of conversation with him on the subject, and he was thoroughly acquainted with my view, namely, that although 22 to 1 did not really represent the relative value counting by stocks of gold and silver, inasmuch as the stock of silver would be very much smaller than that of gold at such a ratio as that, yet I thought it was good, having in view the object of the Indian Government to maintain a ratio of 1*s.* 4*d.*, which would enable them to pay their way. I thought it was very desirable to meet that point, so I talked with Colonel Hay about it, and he seemed to be favourably disposed to my suggestions. But he said "I am an out-going ambassador, and of course I have no power." I pointed out that he would have considerable influence when he got back to America, and assumed office as Secretary of State, and I asked him to communicate with me. He waited for some time after having gone back; he waited, I think, intentionally, till after the Congressional elections, and then he wrote me this letter:—

"Department of State, Washington,
November 25th, 1898.

My dear Lord Aldenham—

I received in due time your first letter and the very full and satisfactory memorandum by which it was accompanied, and I have since received your kind letter of the 9th November, inquiring how far you will be justified in expressing the sentiments of this Government, in the evidence which you contemplate giving before the Parliamentary Committee.

I acknowledge myself much at fault in having so long delayed an answer to your inquiries, but I think you would pardon me if you knew how difficult it was to speak definitely upon such a matter. Our Cabinet, like your own, is considerably divided in opinion upon the question of practical bimetallism, and, while it is true that neither the President nor a majority of my colleagues have in the least changed or modified the views which they held last year, in regard to the great desirability of an international agreement on the subject, they all consider that it would not be expedient for the Government of the United States to re-open the subject at present, in view of the character of the answer which was given to the Bimetallic Commission by the British Ministry in October of last year. They would not be inclined now, any more than they were last year, to take any decisive steps without full consultation with some at least of the more important Governments on the Continent. The question of ratio is one which this Government is open to consider."—He writes this in the knowledge that I had told him that the Indian Government desired a gold value for the rupee of 1*s.* 4*d.*; this would correspond to a ratio 22 to 1.—"We have no cause to suppose that the French Government is not equally in a position to consider any reasonable suggestions respecting the parity between gold and silver, but in the present aspect of affairs it is not thought advisable for the Government of the United States to put forth, either officially or by any private suggestion, any definite propositions to the Government of England in regard to bimetallism. I am afraid this will not be entirely satisfactory to you, and I regret not being able to answer your kind enquiries more definitely. With the most agreeable recollections of my day at Aldenham, and with many thanks for all your kindness,

I am, dear Lord Aldenham
Faithfully yours,
JOHN HAY.

12,846. Is that a private letter?—I wrote to Colonel Hay as follows:—

Aldenham House,
near Elstree, Herts,
February 3, 1899.

Dear Colonel Hay—

I expect to migrate to London (St. Dunstan's, Regent's Park) on the 8th, and to be called before the Indian Currency Committee early in March, when I hope to lay before them the possibilities of joint action on the silver question.

In view of a suggestion in one of my former letters to you that I should not communicate the letter which you wrote to me on the 25th November last otherwise than privately to the Committee, I should not have proposed now that it should be given openly in my evidence, and consequently published in the Blue Book for the information of Parliament and the British public.

But, inasmuch as your said letter to me was not marked "Private," it occurs to me that you may not be at all averse to its being published; as you may probably think, as I do, that it is of very great importance to a happy solution of the question that our Government and people should know, as clearly as you tell me in that letter, that the United States cannot now take the initiative, after the adverse answer given to the Wolcott Mission, yet that the sentiments of the President and of the majority of the Cabinet remained unaltered as to the main object to be attained; and that

your Government would be prepared to discuss the question of ratio in the direction of adopting a lower relative value for silver, if proposals for such discussion should come from this side.

To this I think it very desirable that I should be enabled to speak clearly and openly, and not merely to the ears of the Committee, with a view of showing our people that the objects of commerce generally, and of the Indian Exchequer in particular, would be better promoted by an agreement with the United States than by any of the nostrums put before them.

Of course I shall be strictly guided by your wishes in the matter, but I am inclined to think that your not marking your letter "Private" showed that you wished me to use my own discretion, and be guided by circumstances, as to how and to what extent I should use your letter.

May I ask you to give as speedy an answer as you conveniently can; because I shall have to study my evidence beforehand, and may frame some part of it differently according as your wish may be for or against the use of your letter without restriction.

Believe me, always,
Sincerely yours,
(Signed) ALDENHAM.

In reply to that communication I received the following letter:—

"Department of State, Washington,
February 16th 1899.

"Dear Lord Aldenham—

"I HAVE just received your kind letter of the 3rd.

"My letter of the 25th of November was intended as a private communication, but I have no objection to your making any use of it which you may think expedient.

I am, with best wishes,
Faithfully Yours,
JOHN HAY."

The opinions that I have given here are very prevalent among all mercantile men. All Manchester people, monometallist, bimetallist, and whatever "ist" it may be, they have all taken that view. I had an opportunity yesterday of speaking to Mr. J. Herbert Tritton, a banker of very great eminence. He said he would let me know what he thought about the matter, and he has written me a statement of what he does think. It is not long, and I think it is desirable that it should be in the possession of the Committee, because he is a man of very considerable experience in Lombard Street—which (as is sometimes said) is the City. This is what he says: "The question put to me to-day opens up very "large issues, and a well considered answer is "impossible in the time at my disposal. Writing "as a convinced monometallist, the metal selected "for the standard in any particular country "being so far as the principle is concerned "immaterial, I have looked upon the closing of "the Indian mints as theoretically indefensible, "and the more to be regretted (however great "the cogency of the arguments in its favour at "the time) that it destroyed the only pure mono-"metallic system other than that of this country "at a time when the maintenance of the principle "was of the greatest importance, and this largely "at the instance of the upholders of the monometallic "cause in this country. I am aware of course that the "step was taken partly from a sense of apprehension of "possible evils connected with the exchange, partly as "a transitional measure in view of a gold standard. I "may be wrong, but I fail to see how a gold standard "could be introduced or maintained in India at present "by any means which are reasonably practicable. I "much fear the present regulated and debased "currency (bad as it is) being replaced by a worse "*régime*—viz. a bastard bimetallism. Rather than "go from bad to worse in this way I would extend "the experimental and transitional period, with due "regard to the need from time to time of expansion "in the volume of rupees in circulation. It may be "that the international situation will undergo a change "ere long—the United States and France may find "it necessary to their own interests to adopt a "different ratio, even at the cost of calling in and "recoining their silver dollars and 5-franc pieces. If "their new ratio coincided with the rupee at 1*s.* 4*d.* "the difficulties on all sides would be materially "diminished. The United States and French proposals "were, I thought, rightly rejected in October 1897, but, "if hereafter the only way to re-establish a monome-"tallic standard in India, pure and simple, appeared "to be that this country should make approaches to "other countries concerning their monetary systems, "equally bad and reprehensible at present, as I "believe, from both the bimetallic and monometallic "point of view, I should hesitate to criticise too "closely the initial means which might be taken "towards the adoption of systems more nearly "approaching sound theory and practice than do "those afflicting at present the peoples of the Latin "Union, the United States and India."

12,847. Now, with reference to the par of exchange; do you or do you not think it desirable to have a stable par of exchange?—Absolutely necessary, for commerce between gold and silver using countries.

12,848. Especially between India and Great Britain?—Between India and Great Britain, but important to India especially; really it concerns everything, but for the purposes of this Committee I should say especially to India.

12,849. Do you consider that the action of the Government in 1893, and the system which is now in force has secured a stable par of exchange?—No, certainly not.

12,850. Has it not kept exchange at 1*s.* 4*d.*?—It has not kept exchange at 1*s.* 4*d.*; it has arrived at 1*s.* 4*d.*, which is a very different thing.

12,851. It seems to remain there pretty well now?—Yes; circumstances have been in its favour.

12,852. We have had both famine and prosperity; we have had the two extremes?—Yes, but your exports have been favourable as compared with your imports. Now the imports are very greatly increasing—they naturally would be—and it is the balance of export and import which will determine the question for you. I do not say that 1*s.* 4*d.* has not been reached.

12,853. Therefore, you do not think that the present system may continue?—If you mean the system of closed mints, I think it ought not to continue, except so far as to allow the Government to satisfy yourselves of the experiment before they bring in their undecided and undefined experiment of a gold standard. I say undefined, because nobody has as yet succeeded in defining it.

12,854. Do you consider that the proper policy to pursue now is to continue the experiment a little longer?—That is my opinion.

12,855. (*Lord Balfour of Burleigh.*) Do I understand that you endorse the views expressed by Mr. Tritton in the paper you have just read?—Yes, generally.

12,856. But he says he is a monometallist?—I do not care about that, because, monometallist and bimetallist, we are all agreed on this point.

12,857. (*Chairman.*) I take it that the opinion you have propounded to us this morning, you give not as a monometallist or a bimetallist, but as founded on financial grounds outside that controversy altogether?—Oh yes.

12,858. (*Lord Balfour of Burleigh.*) This gentleman differs from you in respect of the proposals of France and the United States being rightly rejected?—I said it was a great pity that they were so prematurely rejected without an attempt to bring about a modification.

12,859. Mr. Tritton says here "The United States "and French proposals were, I thought, rightly "rejected that year"?—That is what I also said. I said the 15½ to 1 was no doubt attended with some risk, and that it was no wonder that even on that score it was not accepted, but that the proposal of the

Rt. Hon. Lord Aldenham.

16 March 1899.

French Government that we should buy ten millions worth of silver made its acceptance absolutely impossible.

12,860. As I understand it, you condemned the Government of which I have the honour to be a member for closing the negotiations in 1897?—Yes.

12,861. But you are aware that the French Government made it a *sine quâ non* that, if there was to be any ratio established, it was to be 15½ to 1, and they would take nothing else?—That was, I believe, the case then. I have only the printed correspondence to judge by; but I take it from you that it was a *sine quâ non*.

12,862. If so, if the French Government put it to us that they would under no circumstances take any ratio but 15½ to 1, what honest course could the Government take except to close the negotiations?—We know now that a modification is possible, if it was not then.

12,863. We could only act on the information we had at the time. However, I only put this to you because, if you had been doubtful about it all, I would have quoted you passages to show that that was the case. I think we may assume that it was the case that at that time the French Government took up the position that they would not take part in establishing any ratio except 15½ to 1?—I think that is so, but the negotiation was initiated by the United States, who had *not* made that peremptory condition, and it was quite competent for the Government to say "we will negotiate with you." As a matter of fact, I knew at the time that the United States would have negotiated on the subject and you might have left them to settle matters with the French.

12,864. You of course may have known things that were not within the knowledge of Her Majesty's Government, but, assuming that it was the information before us that the French Government would deal with no ratio except 15½ to 1, I repeat my question—what other course could the Government as honest men take except to close the negotiations, and say that that was not permissible?—As you had determined that 15½ to 1 was inadmissible, of course you could do no other than say so; but I do not see that it followed that you must "close the negotiations." We must go back a little and remember that the Government of which you are a member had expressed no opinion at all at that time about the 15½ to 1 except a tentative opinion; on the contrary, the general tendency was to say as I think Mr. Balfour said in the House:—We will do this that and the other, we will open the Indian Mints, for instance, and we are willing to accept these negotiations or we will be leniently inclined to these negotiations. I think it was quite natural that the United States should think that the Government were so inclined. I believe it was not on the question of 15½ to 1 only that the negotiation was interrupted. That was an objection raised by India; but there was also the purchase of 10 millions of silver per annum, which, irrespective of India, would have made it impossible to accept the proposal as it stood.

12,865. You used an expression which I understood to condemn very specially the proposal of the Government of India to melt down a certain number of rupees. I understand (perhaps I was wrong, and if so you will correct me at once) that you thought there was an additional wrongdoing, an additional fault in the melting down of rupees?—Yes.

12,866. You said the natural thing would have been that, when it was necessary, rupees would have been exported?—Yes; not, of course, an exportation undertaken or managed by the Government.

12,867. I want you to explain what difference it would make to the people inside India who wanted rupees whether the rupees, assuming they were redundant, were exported or hoarded or melted down?—It would make the greatest difference in the world, because real redundancy—not redundancy such as is imagined by the Indian Government, but real redundancy—corrects itself. When you get a redundant money in the country, I mean money that is more than is necessary for the actual working of the trade of the country, the result is found in a rise of prices in the country. The effect of a rise of prices in the country is that imports increase, because people send other goods from foreign countries in order to take advantage of the increased prices. When that has happened for a sufficient time the tide turns; that is to say for those imports; those imports have to be paid for, and the balance of trade turns the other way, and the money has to be sent back. Now, whether it is melted or whether it comes in the form of rupees matters not one iota if the mints are open and you can turn the silver into the coin of the country that is useful for the country.

12,868. I follow that, but I understood you to indicate that the mere fact that the rupees were melted and not exported would at the moment accentuate the difficulties of the people on account of increasing the stringency?—So it probably would, because the Indian Government, as it seems to me, start from a wholly wrong view of redundancy. Redundancy is discovered by the people themselves in the increase of prices; but the whole gist of Sir James Westland's despatch is that redundancy means impossibility to keep up exchange at 1*s.* 4*d.*, which is not the point at all. That is redundancy from the point of the Finance Minister of India, namely, redundancy which prevents his rupee continuing at a value different from its real value.

12,869. The particular narrow point that I was on I will put in this way. The difference to your mind between melting and exporting rupees is simply the difficulty in replacing when the demand comes for them to be replaced?—It seems to me a most vicious action to withdraw, in that arbitrary manner, currency from the people—not the "difficulty" but the "impossibility of replacing." But it is not merely that: it is the arbitrary withdrawal by the Government, acting on their own superior authority, of the circulation of the country, judging the matter by their own standard and not by the standard of the needs of trade—to attempt, as the Government does, to force on the people on their own most imperfect judgment—on their own judgment, which they have no real power of forming—that the coinage of the country is redundant. As all authorities have written, and as historically has always been shown, that can only be properly determined by the course of trade. If it is done in the other way it is grandmotherly legislation—to use a phrase that very frequently suggests itself nowadays, and usually recoils upon the legislator.

12,870. (*Sir F. Mowatt.*) In order that I may exactly understand your Lordship's views, let me ask you this: I think you said that, pending the possibility of an international arrangement, you consider that the present experiment should not be disturbed?—I do not want a new experiment put on the top of it.

12,871. That would contemplate, would it not, that, pending such an international agreement, the existing means of keeping the rupee at the rate of 1*s.* 4*d.* should be continued—that exactly the same state of things as is going on now should be allowed to continue?—I think it is very bad, but still I think that, for the same class of reasons as I objected to the 15½ to 1 it would be objectionable to go straight back to the opening of the mints, unless you had some means of breaking the fall. I refer to such means as Sir John Lubbock has pointed out—the seignorage and import duty, each of which has its own defects and each of which has its own merits.

12,872. But I take it from you that, pending some international arrangements of, say, 22 to 1 or thereabouts, you consider it would be wise to maintain the existing state of things?—Almost necessarily, till the negotiation is concluded. If the Government does not negotiate, their only wise course would be to re-open the mints as speedily as may be, devising the best means they can for meeting or mitigating the dangers that might result.

12,873. (*Mr. Campbell.*) You said you would like France to come into the suggested international arrangement?—Certainly, and anybody else.

12,874. Have you any reason to believe that they would be open to entertain such a proposal?—I know that, whereas they were indisposed, there is now a turn of the tide in that respect, they are certainly more willing to entertain the contemplation of such a thing. As you will see from Colonel Hay's letter, he also takes that view.

12,875. But you do not consider their consent essential to an agreement of that kind?—I do not.

12,876. You think that America and India together would from a broad enough basis?—I should say America alone, the Indian Mints being opened to silver. I do not say America and India together, because it would involve putting India upon a bimetallic system, which I do not desire. What I mean is that the United States could do it alone, because France for eighty years almost alone maintained the ratio of 15½ to 1, without a check, and with not the slightest difference in the world, aided one may say—though the aid was not very great—towards the end of the time (it was really nearly a hundred years) by the other nations; I cannot say when they began to take the same view or adopt the same ratio. I remember when Greece and Switzerland were on no such ratio. I say that, if France could maintain it for that time, the United States could maintain it quite as well now. The members of the Gold and Silver Commission expressly said that what would enable two or three or four nations to maintain that ratio depended on their population and commerce. Now, the population of France was then somewhere about 32 or 33 millions; the population of the United States is said to be some 75 millons. The population of the whole Latin Union was 75 millions. So that the United States have the same population that those other countries together had. And then we have to add that it is not population only, but commerce; indeed when you talk of commerce you must include population, because, if you have no population to produce exports and no population to consume imports, there can be no foreign commerce. Now, the commerce of the United States, internal and external, is very much superior to that of France when France was able to maintain the 15½ to 1. Therefore, I say I feel no doubt in my own mind that, as France maintained a much more difficult ratio, that of 15½ to 1, the United States would have no difficulty in maintaining 22 to 1. But for political reasons, and prudential reasons too, they say we must consult with other nations.

12,877. America would then be bimetallic, on a ratio of 22 to 1, while India's currency would be mono-metallic silver?—Yes, exactly as it was before.

12,878. And both countries would be bound to coin whatever silver was tendered to them for coinage?—Yes.

12,879. Taking silver at its present price, about 27*d.* or 28*d.* per ounce, to raise its value to 42*d.*, which is about the equivalent of 22 to 1, would be to add nearly fifty per cent. to its sterling value?—I suppose it would; I have not calculated it.

12,880. The world's production of silver in 1897 is returned at 183,000,000 ounces, worth at the present price about 21 millions sterling?—Yes.

12,881. Then the change in price from 27*d.* or 28*d.* to 42*d.* would at once raise its value from 21 millions to 31½ millions?—Yes.

12,882. Who would absorb this surplus?—It would be absorbed in commerce; the additional *value*, that is. You must remember this: all the silver that is produced is used. There are no stocks anywhere.

12,883. I mean, who would absorb this additional value?—Those people who needed the silver.

12,884. I do not know whether you are aware of the extent to which India took silver before the mints were closed as compared with the extent to which she takes silver now?—I have not got that at my fingers' ends.

12,885. The difference is small. She takes about 3 millions' sterling worth less now than she did before the mints were closed?—In sterling value?

12,886. Yes; so that if she were to go back to her old consumption India would only absorb about three millions of the surplus?—Yes, that is the difference; and she would take just what she did before, unless anything had happened or did happen to increase the trade of India.

12,887. Then as regards the other silver-using countries, what do you think would be the effect of a rise of 50 per cent. in the price of silver on the demand for these countries?—I do not think it makes any difference at all. The difference in the value, you may call it, of gold, makes no difference in the quantity of gold that comes to this country or is used. What would happen probably would be, I should say, a slight increase of prices; spread over so large an area it would be but a slight increase.

12,888. You mean in silver prices?—No, an increase in silver prices of commodities; but it could not be very great, because there has not been that great fall.

12,889. But would not a rise in the sterling price of silver to 42*d.* mean in silver-using countries a fall in silver prices?—In the gold price of silver, but not in the value of commodities, which is the real thing we have to consider.

12,890. If silver rose from 28*d.* to 42*d.*, would not the result be that prices of commodities in silver-using countries would fall?—It has not been the consequence that they have risen materially when silver fell, as measured in gold. I should say it had very little to do with it; because what does it signify to the owner of silver in the interior of India whether the price in cowries or the price in gold is different to what it was?

12,891. As regards the production of silver, what would be the effect on that of a rise in price of 50 per cent?—I think I may answer that pretty clearly. It would bring into use, or rather into production, all those (if any) mines producing recalcitrant ores which require a greater expense to bring into use than the old price would allow; but no man in the world leaves his silver lying idle in his mines when he can get ½*d.* an ounce profit on it. I believe those who are interested in silver or gold get from their mines all they can in all cases, till, and even after, it shows a loss, because they always say "next year things will be better, there will be better production."

12,892. But do you not think a rise of 50 per cent. in the value would stimulate the production?—It does with all perishable and consumable commodities, commodities that can be produced at will; but I do not think that is the case with the precious metals.

12,893. Have you formed any idea as to the extent to which, with the American mints open to silver, America might be called upon to take and coin silver?—I assume you are taking 22 to 1. I do not think she would be called upon to take any quantity. France was not flooded with silver (though her mint was over-worked), even in 1873, for she coined less in that year than in several previous years. All the silver that was produced almost came to Europe, except what the Americans kept back for their own purposes. Many people say, "Where is the demand—who will want any more silver?" Nobody, perhaps; admit that nobody wants any more silver; yet if you had a bar of silver sent to you, and you found that France, for example, would pay 15½ to 1—that France would give you 200 francs in account for your kilogramme of silver, you would never sell your kilogramme for less than that. Why should you? And the same, whatever the ratio.

12,894. During the time that the Sherman Act was in operation, and when silver was, latterly, at all events, if anything under 42*d.* an ounce, in order to keep silver falling still further, was it not the case that America had to take 54 million ounces annually?—Yes; she bought them at the London price, but it

Rt. Hon. Lord Aldenham.

16 March 1899.

was in hopes not only to save silver from falling but to establish purity.

12,895. Do you not think that, if you put silver up to 42*d.*, you might practically revert to the conditions which prevailed then, and that, in order to prevent silver falling below 42*d.*, America might again have to take something like 54 million ounces annually?—I should think not; I do not see it at all. If America wanted more silver for her coinage or any other purpose, she would have it. If she did not want it, she would not have it. But, whenever the demand for silver arose, whether in China or India or elsewhere, for manufacturing purposes or any other purpose whatever, there the American ratio must necessarily place a minimum on the price in the market.

12,896. But is it so much a question of what America would want in regard to silver currency, as of what people might send her? She would be bound to take whatever is offered to her?—So was France.

12,897. Whatever silver America coined under that regulation would remain with her in currency?—It would remain with her unless and until there was any demand externally.

12,898. If there was a demand externally would it not be her gold which would go?—It would depend on what the price of silver was elsewhere.

12,899. But who would take her silver? The mints of Europe are shut; there is only India and China?—Well, *only* India and China! That is true. I do not think it is necessary to go very much farther into that. I hold that, if you can get a definite sum per ounce anywhere, you will not take less; any more than when you can get 3*l.* 17*s.* 10½*d.* for your ounce of gold you will anywhere take less.

12,900. Therefore, if, with the competition of the Council Bills, India would not pay 42*d.* per ounce for silver, the silver would be sent to the States?—The silver would follow where the price of silver leads. Then I was going to mention this. During the time from 1785 to 1876, France never was overburdened with silver. Owing to the difference of ratio there was a change between silver and gold, and another change back again; but she never got her prices of commodities raised (which is the only test) by too great abundance.

12,901. Would you admit that during the operation of the Sherman Act, there were any apprehensions of America losing her gold standard and going on to silver if the Sherman Act had been continued?—There were plenty of apprehensions; there were always people who said that she never had what I call a gold standard; but still, there was an apprehension that she might lose the gold she had, and she was losing some of it, no doubt. In France, in 1853, there were serious "apprehensions" that all the silver would go away, and M. Chevalier proposed accordingly that gold should be demonetised.

12,902. If a similar condition were to come again, and America had to take whatever silver was offered to her, and to absorb as much as under the Sherman Act, do you not think the result would be that gold would go to a premium in America?—I do not see why it should, unless it were necessary to pay American debts (which you will remember are greatly diminishing), in some metal or another; then, of course, she must send a metal that will be accepted by other countries; but it could not happen unless the balance of trade was, and continued, against her. This last year the balance in her favour was 120,000,000*l.*

12,903. Suppose that gold did go to a premium, that would only be another expression for depreciated silver?—You might call it so, but I do not think it would be accurate. It is all guided by prices of commodities, the whole thing. I do not care for depreciation of silver or for appreciation of gold in silver, excepting so far as it affects commodities generally. Appreciation of gold is a depreciation of commodities, of course, we know that, and depreciation of silver is an appreciation of commodities.

12,904. If gold were to appreciate and you did get a premium on gold in America, that would enable you to the extent of that premium to buy silver cheaper?—I doubt that; I am not quite sure of that. The premium would be a charge on the export of gold, and would have little or no effect on internal prices of silver. As to the supposed flooding of the United States with silver, the Committee must not forget that if any silver were sent thither at the ratio of 22 to 1, it would have, as money, 37·6 per cent. (the difference between 16 to 1 and 22 to 1) less purchasing power, as compared with gold, than it now has, and that this would be the case with all silver produced in that country which is so used.

Thus, we may estimate the production of 1898 on the known production of 1897 - - $69,637,000
Imports in the fiscal year, 1898 - 30,929,451

$100,566,451

Less exports - - - 55,751,597

$44,814,854

all of which is needed, and used, in the country.

Now, assuming the figures to be the same as then, this at a ratio of 22 to 1 would be reduced to $27,964,469; and the need being the same, the balance $16,850,385 would have to be provided by additional imports.

I do not know whence these are to come, unless (1) the imports into India fall off, or (2) the world's production increases.

(1.) Now is there any reason to expect that the Indian imports of silver will be less? I see the net imports in—

1896–7 were about £3,400,000 (rupee average 1*s.* 2*d.*·454).
1897–8 „ 5,200,000 (rupee average 1*s.* 3*d.*·393).
1865–6 „ 18,000,000 (rupee average 23¾*d.*).

(2.) Will the world's production increase owing to a rise of price to 42*d.*?

I see that the production in the United States has steadily increased from 24,518,000 fine ounces in 1875, when the average price was 56⅞*d.* to 53,860,000 fine ounces in 1897 when the average price was 27 9/16*d.*

This, of course, affords no proof that production will fall off with increased price; but it certainly affords no presumption that the production must materially increase. The miner will always get all that his mine will give him. If silver should abound, and prices should rise in the United States, and the exchanges should be permanently against the country (very doubtful premises) then their $861,514,780 gold (about £170,000,000) might be gradually diminished; and assuming the impossible, that population and commerce remained absolutely stationary, and that 183,096,090 fine ounces (the production of the whole world in 1897) were poured annually in the United States, and that they had to export the whole of that sum in gold every year, and produce none at all at home (instead of $57,000,000 as in 1897), then, and only then, in about 5½ years all the gold would go to Europe. The mere statement of the conditions shows the conclusion to be beyond the pale of possibility.

12,905. (*Mr. Holland.*) You have mentioned your reasons for objecting in 1893 to the closing of the mints. Do you still hold the same views that you held in 1893?—Yes—that it was a very evil action; and, like many other evil actions, done with very good intent.

12,906. But I do not quite understand, from what you have said, whether you consider the experiment of 1893 to have been a failure or a success. In one part of your evidence I gathered that you considered that it had been a failure; in another you said that it was too early to pronounce judgment; you say you "do not consider that the circumstances attending "the experiment yet justify a definite conclusion."

(*Chairman.*) What you say is, that you disapproved of the plan altogether, you considered it a blunder, but, now that the blunder has been committed, you consider it would be unwise at present to enter upon another experiment?—Exactly.

12,907. (*Mr. Holland.*) Do I understand rightly that you consider a gold standard to be impossible without a gold currency?—When there is not a gold currency, that is to say, when you are not obliged to pay your debts in gold, that is not a gold standard. That is what I meant.

12,908. Does your objection to a gold standard apply to all the forms of it that have been submitted to us by the different witnesses; do you object to every scheme that has been laid before us?—I have a general objection to every one; that is to say, I do not consider them a gold standard at all if they have not a gold circulation in the form of note or in the form of gold, one or the other, or both.

12,909. Do you consider that, in any scheme for a gold standard, convertibility both ways would be essential?—Yes, but that is only saying that it could not be had.

12,910. Are you aware that Lord Farrer sees no objection to the Government undertaking the responsibility?—I know, but he also says that the Bank of England must take the responsibility.

12,911. You contend that India is at present at a disadvantage in competition with silver using countries?—Yes.

12,912. You also contend, I think, that that disadvantage would be increased by the adoption of a gold standard. In what respect?—You should not make the money of a country diverge from its natural value, as has been done in India—a divergence which would be increased if India had a real gold standard. The economic dangers to India have been excellently set forth by Sir Edward Sassoon in a paper read before the Society, on which I need say no more, as I understand it will appear in the proceedings of this Committee.

12,913. When the negotiations of 1897 with the United States and France fell through, was not the door left open for other proposals, if those countries had been so minded?—I should have said that it was not, but I have heard some representations advanced that the door was not absolutely closed. But I think I have been informed by the highest authorities that it had been closed. It was not closed to *other* proposals; but unquestionably the American proposals were peremptorily rejected. They contained a condition *sine quâ non*, that the Indian mints should be opened to silver; and having regard to the following words in Senator Wolcott's speech in January last year, when reporting to the Senate on his mission:—

"Thus, Mr. President, speaking very briefly and very hastily, I have covered the other suggestions that were made to the English Government when we were requested to indicate what contributions England could make. All other proposals, however, were of infinitely small importance compared with that respecting the re-opening of the mints of India to the unlimited coinage of silver and the repeal of the order permitting gold to be paid for Government dues and to be exchanged for Government rupees;" it is clear that there had been no insistence on his part on the old ratio. It still seems to me that it would have been desirable, in the interests of India and England, and of commerce generally, for our Government to answer, "We cannot consent to a ratio "of 15½ to 1; but, if the United States are willing "to modify that, and can agree with us as to the "extent of the modification, the chief objection of "the Indian Government would be removed." This opportunity again lies before our Government, and I must hope that this Committee will recommend them to seize it. It has indeed been suggested that the Indian Government apprehend that the United States might grow weary of any such treaty; but no one, of course, seriously believes that there is any fear of its infraction by either party, or would fail to see how forcible would be the political reasons for maintaining such a treaty as I am considering.

12,914. (*Mr. Le Marchant.*) Do you think, if India had a gold currency, the demand for gold would be in very large amounts?—I do not, unless it is for hoards. That is why I think you will never establish a gold currency.

12,915. In fact the difficulty arises rather from the absence of demand?—Greatly; that is to say, demand for its use as a circulating medium.

12,916. And, therefore, from there not being a sufficient proportion of gold in the circulation?—I remember what Mr. Joseph Harris said on that point in 1750. Speaking of England he said, "Silver "is the standard of this country. Make what laws "you please, and silver will still be the standard of "this country." He was one of Lord Liverpool's chief witnesses. He said, "When I say it would be "the standard of this country, I mean that it will "be the basis of all ordinary internal operations of "this country." There is also what he called "a standard of merchants," which is exactly equivalent to what Sir John Lubbock calls an exchange standard. In those days the people had gold and used it in that way; it was the standard of merchants. In the last century, when exchange served, gold came, and our merchants amassed it, and used it when they wanted it, and at that very time Harris said, "silver "is our standard, but we must have gold also as "money."

12,917. You are aware that in the past gold was current in India?—I know it was current in some parts of India—in Madras, I think—but I also know that it was discontinued.

12,918. Still there were evidences that it was popular locally?—Yes; I think that cuts both ways. It could not have prevailed in the ordinary transactions of the mass of the people.

12,919. One question with regard to the par of exchange; I gather you are not of opinion that a depreciating currency is of advantage to a country?—It is a temporary advantage to shippers—to exporters—but a very great disadvantage to the country. India has benefited by a low rate as compared to England. When India could sell her wheat, say, at 40*s.*, and afterwards could get the same quantity of rupees selling her wheat at 35*s.*, that was to the advantage of India; it was no profit to the country generally, but it enabled Indian exporters to undersell the unhappy English agriculturalist.

12,920. Do you regard that as a permanent advantage?—Not to the country at all; if I did, I should advocate a paper currency. There is a great difference between a currency depreciated by the action of nature, whether on the metallic measure or on the commodities measure, and a currency depreciated by the action of the State. To the former, nature herself brings an infallible remedy; to the latter, being such as the Indian Government has brought about, no remedy can be applied; the divergence between the face value of the coin and its intrinsic value continually tending to increase.

12,921. (*Sir A. Dent.*) You said that you absolutely disapproved of a gold standard for India, and one of the reasons you gave was that it so largely diminished the stock of gold in this country?—It would tend to do so if successful.

12,922. Will you give a reason why Lombard Street, which you say is the City, should object so much to a portion of the largely increased supply of gold going to India as it now goes to Russia, Austria, or Japan? Why should Lombard Street object to India having gold more than those countries?—Lombard Street must answer for itself, but still I take it that what they mean is that the demand at present for those countries that you spoke of has been sufficient to absorb the additional production that has taken place. Besides, it is no use for us to object to what Russia may do, and she apparently will go on

Rt. Hon. Lord Aldenham.

16 March 1899.

doing it. You may say the same of Austria, only she locked up her gold.

12,923. Those supplies of gold will probably go on steadily increasing?—That is a matter that we do not know anything about. There will be no difficulty about getting the gold, but plenty of difficulty about the results of getting it.

12,924. (*Chairman.*) Is there anything more that you wish to say to us? I remember that you desired to amplify your answer to my question about a par of exchange?—A par of exchange, in my opinion, can only be attained by the course which I have suggested. It may be convenient to the Committee that, in conclusion, I should sum up the evidence which I have given.

My objections to the closing of the mints are that it has substituted a managed and artificial system, and a debased money—the system of money which prevailed in England in the days of the Plantagenets and the Tudors—for the automatic system and honest money which has prevailed in India from time immemorial, and which is the same in principle as that which has obtained here from 1666 to the present day.

No government can efficiently and beneficially regulate the volume of currency, which, in a well-ordered State, regulates itself according to the needs of trade.

The new departure of 1893 aims only at the improvement of Government finance, neglecting the interests of the people, whose hoards of uncoined silver are arbitrarily lessened in purchasing power, and whose trade is imperilled in competition with China and other silver-using countries.

It was but an experiment, the success of which, even from the point of view of its authors, is by no means assured; and it will be the more unwise to attempt to graft upon it a new and very doubtful experiment of a so-called gold standard.

A monetary standard, of whatever metal, is that by which a nation, as a whole, measures its transactions in buying and selling; and in that acceptation there can be no doubt what the standard of India is. Make what laws you please, it will remain silver.

But the "gold standard," as the phrase is used by the Indian Government, is only a suggestion that the exporter is to think of his rupees as a varying number of English pence, approaching as nearly as possible to sixteen, while in his dealings with China, the Straits, and Mexico, he still thinks of them as proportionate parts of a silver dollar.

As a medium of exchange and measure of value used by the Indian people, gold seems impossible, and to make the existing rupees a token coinage by limiting their legal tender, is to subject them to the same depreciation as is now suffered by the uncoined hoards.

The whole scheme, in my opinion, must be abortive; but if "successful," or so far as gold could be forced on the people, it would cause them dissatisfaction, and perhaps disaffection, and, to all gold-using countries, a strain on their gold reserves, checking such return of cheerfulness to trade as the cessation of a period of constant fall in prices has lately brought.

In deprecating the attempt to give a further extension to the monetary use of gold, I recall the words which Mr. Goschen said to me in Paris—at the International Monetary Conference of 1878—that for the good of commerce, gold and silver should be shared among the nations, those using gold who preferred gold, and those using silver whom silver suited best. And again, speaking in the House of Commons, April 16, 1690, he said:—

"I have contended, and I am prepared still to contend, that I should prefer the currency of the world to depend rather upon two metals than upon one. I am not now speaking individually of this country and the United Kingdom, but I should like to see silver pressed into service to do the work of the currency of the world, as well as gold, so that the currency of the world did not depend on one metal, but upon two."

In advocating the policy of furthering the adoption by another State, or by other States, of a concurrent mintage of gold and silver legal tender money, I am fortified by the opinions of the members of the Royal Commission on Gold and Silver already referred to (No. 12,841), and also by the Despatch of the Government of India of the 21st June, 1892, signed by (amongst others) Lord Lansdowne, a member of our present Government, and by Sir David Barbour and Sir Charles Crosthwaite, members of this Committee; paragraph 8 being as follows:—

"It may, perhaps, be desirable to make known at some stage of the proceedings of the Brussels Conference our views regarding the introduction of a gold standard into India. But this question, as well as the question of the expediency of India negotiating directly with the United States of America, as suggested in our telegram of 19th May, may stand over till the Conference has assembled, and the representatives of India are in a position to report what the prospects are of a satisfactory solution being attained."

The telegram of May 19 referred to, is quoted in the Despatch as follows:—

"We desire to call your Lordship's attention to paragraph 133 of Part II. of the Final Report of the Gold and Silver Commission, and to suggest that, failing an International Agreement, it may be possible for India and the United States to come to a direct agreement as to coinage of silver . . . . We are of opinion that the time for a merely academic discussion of the problem is past, and urge that a determined effort be made to settle the question by the adoption of practical measures."

I am also fortified by Sir James Westland's Despatch of the 16th September, 1897, paragraphs 2, 4, and 8, which I have already quoted (No. 12,839).

No. 8 giving a reason for the rejection of the American proposals which, as I have shown, rests on no certain foundation.

The adoption by the United States of the ratio of 22 to 1, proposed in the plan here laid down—

Would at once end the controversy, and, by establishing the par of exchange, would enable the Government to open the mints to silver;

Would give the country automatic money;

Would give it a par of exchange with both silver and gold-using countries;

Would remove the economic disadvantages under which it labours in competition with other silver-using countries;

Would attract capital by the prospect of profitable employment, and so help towards the development of India;

Would save it from the perils of a "managed currency," and would save the Government of India from the risk of maintaining the exchange, and from the dangerous liabilities which they might incur in endeavouring to force a gold standard on the people;

Would save commerce from the dangers of an excessive strain on the gold stocks of the world;

Would give 300,000,000 of people a currency which they prefer;

Would restore their uncoined hoards to their pristine value, making them, as before, money at weight for weight—at once a measure of justice and an avoidance of possible political trouble.

These advantages are patent to many men eminent in commerce and finance. Lord Northbrook (among Statesmen), in his evidence before this Committee, claims as one of the recommendations of his plan, that it would in no way preclude such an arrangement as I have suggested being subsequently concluded.

The Commerce of Manchester is unanimous on the subject. Sir F. Forbes Adam writes me the following letter:—

"Mere Old Hall,
"Knutsford, Cheshire,
"14th March, 1899.

"Dear Lord Aldenham,

"I AM obliged to you for letting me know that you are about to appear before Sir Henry Fowler's Committee, and that you intend to give evidence in support of the suggestion I made in July last, that it would be a satisfactory solution of the Indian Currency problem if an arrangement could be made that America should open her mints to gold and silver at the ratio that is the equivalent of a 1*s.* 4*d.* rupee, on condition that the Indian Government resumed the free coinage of silver. You say you intend to testify to the practicability of such an agreement if our Government took the matter up and went forward with it. This is very important. I have always felt that, if it could be brought about, it would be received with approval by the different currency camps in Lancashire, and by all shades of opinion. It would also suit the Government of India, and reconcile divergent views entertained by commercial and other authorities in Calcutta. But I was doubtful if America would listen. Should you be able to show the Committee that there is a reasonable hope of an arrangement being possible within a specified time, it must carry great weight with them.

"Believe me to be,
"Very truly yours,
"(Signed) F. FORBES ADAM."

And the views of Mr. Barclay, whose opinions on the general monetary question are opposed to his, have been fully set before you. No one is more competent than they to express the views of Manchester, and no part of England is more interested in this question than Lancashire, of which Manchester is the commercial capital.

As to the City of London, for which I may venture to speak personally, all parties are desirous of seeing this long controversy settled. You have heard the opinions of Lord Rothschild and Sir John Lubbock, and know that they, as well as Mr. Herbert Tritton, who may be numbered among the chief representatives of finance and banking, have expressed approval of an agreement being made on some such basis.

Rt. Hon. Lord Aldenham.

16 March 1899.

I may mention also that Mr. Stephen Ralli, whose eminence as a merchant is known to you all, and whose combined export and import trade with India is by far the greatest, has personally told me that such a settlement, if it could be effected, would, in his opinion, be "the best solution," and he has authorised me to make this declaration upon his behalf to this Committee. He also says that, after making inquiries on the subject amongst his friends in the City engaged in the Indian trade, he finds that Mr. R. Williamson, of Messrs. Finlay and Co., Mr. Brown, of Messrs. Kilburn, Brown and Co., and others, share his opinion; indeed, he says he has "no doubt that such is the opinion of all experienced Indian merchants."

I have also been informed by other friends who are in a position to know, that this view is largely held amongst those engaged in tea planting and other productive industries in India and Ceylon.

To speak of economic authorities who are in favour of an international arrangement, I would mention only Professor Marshall, whom you have heard, Mr. Courtney who is to appear before you, and Professors Foxwell and Nicholson.

If this Committee should recommend the furtherance of the plan here proposed, and if, through their instrumentality, a par of exchange were secured for India's trade with gold and silver standard countries, and not for India's trade only, but also for England's, and indeed for the mutual trade of all gold standard and silver standard countries, it is impossible to exaggerate the benefit which would accrue to commerce.

Such a consummation would make those old-time monetary handmaidens of commerce—gold and silver—once more together do the money work of the world.

The witness withdrew.

Mr. HENRY DUNNING MACLEOD called and examined.

Mr. H. D. MacLeod.

12,925. (*Chairman.*) You have studied and written on economic subjects, and especially currency, for the best part of half a century?—I have.

12,926. Have you had great banking experience?—Yes. It all arose out of my being director of a bank. In the beginning of 1854 I was in the directorate of a bank, and, from circumstances which I need no mention, I was then compelled to examine thoroughly and critically the current works on Economics. I at once perceived an extremely grave defect in them—that they gave wholly insufficient attention to the history and theory of the coinage, which is of supreme importance in the economics of any country. In my "Elements of Political Economy," published in 1857, I gave a sketch of the history of the coinage of England, and in this inquiry I came across the doctrine which I have designated as "*Gresham's Law*," and which is now accepted throughout the whole world, and which is of supreme importance in the subject before the Committee. Being then trained in mercantile law by one of the most able and accomplished lawyers of his day, Mr. Edward Bullen, and having all the operations of banking going on under my own eyes, I found that the writers of these works, who were only literary men, never had the faintest conception of the great juridical and scientific principles and organisation of the colossal system of credit, nor of the mechanism of banking in its various forms. Shortly, then, being well conversant with all the subjects which these writers dealt with, I saw that, though there were many good ideas in them, they were such a chaos of confusion and contradictions that they were of no use for practical business. I then determined to make it the main business of my life to reduce this chaos of contradictions into scientific order, and to raise economics to the rank of a great inductive science similar to the standard works on physical science.

12,927. You are also very familiar with Indian currency questions?—I have studied the question of Indian currency from the dawn of authentic history up to the present day.

12,928. Were you in favour of the closing of the Indian mints to silver in 1893?—I am of opinion that it was absolutely indispensable to close the mints to the free coinage of silver in 1893 to save the Government of India from bankruptcy. As a matter of fact, it ought to have been done in 1864. The lamentable action of both the Indian and Home Governments was the culmination of a long series of economic errors which have brought about the present disastrous state of Indian finance.

12,929. Have you any specific reason that you would wish to mention in addition to what you have already stated?—No, I think that is sufficient.

12,930. Now, what do you think about the proposition which has been so much pressed upon us to re-open the mints to the free coinage of silver?—I think it would be simple madness. I was going to give you my reasons for saying that the mints ought to have been closed in 1864.

12,931. We are not empowered to inquire into that matter. We are empowered to consider the question of the closing of the mints in 1893, and even that is rather a preliminary part of our inquiry. I understand you to say that you consider that that was a necessary step in 1893?—Absolutely indispensable.

12,932. And that it would be a very foolish thing to open them now?—Yes. From the observations I have already made, I am utterly and entirely opposed to reversing the policy of 1893 and re-opening the mints to the free coinage of silver. In

Mr. H. D. MacLeod.

16 March 1899.

my opinion such a course would be little short of madness. Such a course would inevitably lead to the bankruptcy of the Indian Government. I may set before you the losses which India has sustained by the unfortunate policy of keeping the mints open to the free coinage of silver from 1864, when they ought to have been closed, to 1893. The Indian Government acknowledges that every penny which the rupee falls necessitates taxation on the people to the amount of 1,000,000*l.*, to meet its charges payable in London. The fall of the rupee from 2*s.*, at which it was in 1864, to 1*s.* 4*d.*, which may be taken as its present rate, therefore necessitates taxation to the amount of 8,000,000*l.* a year for the above purpose. I have not gone very minutely into the calculation, but I think that I may say that the losses by exchange to the Government since 1864 have not been less than 100,000,000*l.* The Committee, however, can verify this estimate for themselves by applying to the India Office. Two-fifths of the revenue of India are paid in rupees under contracts for terms of years. By the fall of the rupee from 2*s.* to 1*s.* 4*d.* the Government has lost $\frac{1}{3}$ of $\frac{2}{5}$ths of its revenue—$\frac{2}{15}$, or more than 13 per cent. of its revenue. These losses have had to be made up by laying tax after tax upon the people, till it is now acknowledged that India is taxed to the very limit of its endurance. Then all British officials have lost one-third of their incomes. It is true that in some cases a slight compensation has been made; but this compensation does not make up for their heavy losses. Numerous officials are now retiring because their pensions, which are paid in sterling, are more than the compensation allowed them in India. The fluctuations in the exchange give rise to speculations in the exchanges, and, as Copernicus said of the gains made by money dealers in collecting good coins out of degraded coin, the gains of the speculators in exchanges are the losses of everyone else. It is proved by witnesses that the difference between the standards has greatly hampered the trade between India and Australia. The difference of the standards between England and India has greatly impeded the investment of British capital in India, because the expected profits may all be swept away by the fluctuations of exchange. If the mints were re-opened to the free coinage of silver, it is estimated that the value of the rupee would at once go down to 10*d.*, which would mean additional taxation laid on the people to the amount of 6,000,000*l.*, besides the proportional aggravation of all the other losses I have detailed above. But I think that it is probable that the rupee would go much lower than 10*d.* Since the Gold and Silver Commission of 1887, the most productive silver mines in the world have been discovered. I am informed that at the most productive silver mines of Mexico and Australia silver can be produced at from 10*d.* to 11*d.* an ounce. Moreover, by more refined processes, the cost of producing silver is being constantly reduced. All the depreciated silver in the world might be dumped down on India. And I think that we might reasonably expect that the value of the rupee would go down to 6*d.*, and by no means improbably even lower than that, and that would at once spell bankruptcy and ruin to India. Some persons with a light heart suggest that these further losses might be met by additional taxation, but I do not think that such persons have well considered the effects of attempting to increase the burden of taxation to such an extent. Such persons, I think, are somewhat similar to M. Ollivier, who entered on the Franco-Prussian War with a light heart. To attempt to increase the taxation of India by 10,000,000*l.* would, to my thinking, simply mean revolution. Moreover, Mr. Lindsay, on this point a very competent witness, says that the fall of the rupee to 11*d.* would cause a great withdrawal of capital from India; still more if it fell to 6*d.*

12,933. (*Sir F. Mowatt.*) May I gather from that answer that the *status quo* should be continued?—No, I am against continuing the *status quo*. The primary object of this Committee being to devise a means for bringing about a stable par of exchange, barring the usual fluctuations of commerce, between England and India, as the indispensable preliminary to rectifying the monetary system of India, I have shown that there is no possibility of attaining such a result, either by adopting bimetallism or by re-opening the mints to the free coinage of silver. There remain only two alternatives: (1) either to allow the present *status quo* to continue, or (2) to restore its ancient gold currency to India, but on an improved system. Now, the maintenance of the *status quo* is as incompatible with the object of the Committee as the two previous suggestions. The Secretary of State for India himself declared the present position—that is to say, the *status quo*—to be "intolerable," and it is quite impossible to bring about a permanently stable exchange between England and India by maintaining the *status quo*. No doubt, during the last 18 months or so, the exchanges have kept pretty steady, a little above, or a little below, 1*s.* 4*d.* But that is a fortunate accident and cannot be depended on as a permanence. Since 1893 the rupee has been as low as 1*s.* 0$\frac{3}{4}$*d.*, and there is no reason why it should not be so again. On some occasions the rupee has been kept higher by manipulating the Council Bills, but that cannot be adopted as a permanent system, for obvious reasons. Therefore, the maintenance of the *status quo* must be equally ruled out with the other two suggestions as incompatible with the establishment of a stable par of exchange between England and India. Having carefully and assiduously studied for upwards of forty years the history of the coinage in many countries and the theory of coinage, I may state it as an incontrovertible fact, demonstrated by experience and by argument, that it is impossible to maintain a fixed par of exchange between countries which use different metals as their standard. It is absolutely impossible to establish a stable exchange between England and India, barring the usual fluctuations of commerce, except by adopting the same metal as the common standard of the two, which practically means declaring the sovereign the standard unit both in England and India, as was so earnestly demanded by the people of India in 1864.

12,934. That means that you advocate the effective establishment of a gold standard in India?—Most assuredly.

12,935. Do you contemplate that with or without a gold currency?—Most assuredly with a gold currency.

12,936. You consider that the history of the Indian currency, of which you have told us you have made a study, shows that a gold currency would be popular in India?—I do, most assuredly. The whole history of Indian currency shows it. In discussing the momentous question before the Committee it will be well to dispel two very prevalent misconceptions. (1.) It is a very widespread opinion that from the earliest antiquity silver was the sole measure of value in India, to which the people from time immemorial have been habituated, and that it is not possible to change the inveterate habits of the people so as to induce them to welcome the change from silver to gold. (2.) That India is too poor a country to have a gold currency. Both these assumptions are entirely erroneous. In the very earliest ages India had only a gold currency; India produces much gold but no silver. But, from a very early period, Western nations imported vast quantities of silver into India, partly to purchase gold, because gold was cheaper there than anywhere else—the ratio of silver to gold in Persia was 1 to 13; in India it was 1 to 8—and also to purchase Indian products. India was in those days a very highly civilised country, while Western nations were still barbarous. Consequently India wanted no Western products, and would sell her own products for nothing but the precious metals. But the silver was only brought to Northern India, because the country of the Lower Indus was the great producer of gold. There was no silver money in

Southern India till 1818, when the East India Company forced the silver rupee upon the people for the first time against their will. Then, in 1835, the East India Company declared their silver rupee to be the only legal tender throughout India, while gold coins were allowed to circulate at their market value. On 1st January 1853 Lord Dalhousie demonetised the whole immense gold currency of India. So it is to be observed that it is only since 1st January 1853 that India has been a solely silver-using country, and not from time immemorial as is so often supposed. Then, to show that the natives greatly prefer gold, I have only to refer to the report of the powerful and unanimous movement throughout India to have their ancient gold currency restored to them, published as a Parliamentary Paper in February 1865. As this document is in your hands, I need not refer to it, and, no doubt, it will receive due weight from the Committee in coming to their decision. Lastly, I think it only necessary to cite the evidence of Mr. Lindsay, who, strange to say, is such a vehement opponent of granting to the people of India what they so ardently desire. Mr. Lindsay says that, if the people of India had the opportunity, they would at once restore an enormous circulation of gold coins. I fervently trust that the Government will gratify this desire as speedily as can be done. I think I have said quite sufficient to prove the case.

12,937. Will you give the Committee your views on Mr. Lindsay's scheme?—I have carefully and critically examined the lengthy evidence given by Mr. Lindsay before the Committee, partly on account of the prominent position held by Mr. Lindsay in the Bank of Bengal, and partly because his scheme has been received with a certain amount of favour in India itself. Mr. Lindsay gives a good many details of business, and on these I am in general agreement with him. Mr. Lindsay's object is to restore a gold standard to India; on that point I am in agreement with him. But his object is to restore a gold standard without a gold currency, and on that point I am utterly opposed to him. Mr. Lindsay admits (Q. 3591–2), that, if such a scheme as I propose were carried out, it would result in an enormous circulation of gold currency in India, and that the natives would eagerly adopt it if they had the opportunity. Now, as I have submitted to you, the preference of the natives is for gold. The silver currency has been entirely forced on India by the violent action of the Government. Now, if Mr. Lindsay admits that if the natives had the chance they would enthusiastically adopt the gold currency, I ask, where is the sense of forcibly obstructing the wishes of the natives themselves? Mr. Lindsay wishes to throw every possible obstacle in the way of establishing a gold currency. I, on the contrary, wish to facilitate the wishes of the natives in every way that can be done, and to restore its ancient gold standard to India as speedily as possible. Moreover, suppose that the gold standard is restored, is it not obvious that the greater the quantity of gold circulating throughout the country, the safer and the more stable it will be? Mr. Lindsay has based his scheme on two supposed precedents. But I must be permitted to say that Mr. Lindsay has quite misconceived these two precedents, and that they have no bearing on the present questions; and I must explain them as briefly as possible:—1. *Ricardo's Scheme.* During the eighteenth century there were several monetary panics, and the Bank of England surmounted them with great skill. But after 1797, when the Banks of England and Ireland were directed by Act of Parliament to suspend cash payments, they flung away the rules by which they acknowledged themselves to be bound while they had to redeem their notes in gold. They both adopted a theory which they dug out of Adam Smith. They increased their issues of notes enormously. Their notes fell to a heavy discount, and consequently the foreign exchanges fell heavily, disorganising commerce. A Committee of the House of Commons in 1804 condemned the theory on which the Irish Bank was acting in the severest language. This arrested the depreciation of the bank note for a short time. But in 1808–9, the Bank of England had again very greatly increased its issues of notes, and also the country banks had multiplied greatly. The paper discounted by the bank in 1795 was 2,946,500*l.*; in 1809, it rose to 15,475,700*l.*; and the country banks, which had been 270 in 1797, increased to 600 in 1808, and to 721 in 1810. At the same time, the paper price of gold rose from 4*l.* in 1805 to 4*l.* 11*s.* in 1809; and the exchange with Hamburg fell from 35*s.* 6*d.* in 1805 to 28*s.* 6*d.* in 1809. At the same time two prices prevailed in the country, a gold price of 21*s.*, and a paper price of 27*s.* In 1810, the Bullion Committee condemned the theory of the Bank of England exactly as severely as the Irish Committee had condemned the Bank of Ireland. The House of Commons threw out the resolution of the Bullion Committee and voted that bank notes and guineas were equal in public estimation, which was affirming that 21 was equal to 27. The bank being thus freed from all control, increased its issues more extravagantly than ever. In November the paper price of gold was 5*l.* 10*s.*, and country banks increased from 728 in 1811 to 940 in 1813, and their notes issued were estimated at 25,000,000*l.* This huge mass of inconvertible paper in circulation depreciated the value of the bank note to 14*s.* 2*d.* In the autumn of 1814 the country banks began to fail, and during 1815–16 400 country banks failed, and the amount of notes in circulation was little more than half what it was in 1814. The removal of this mass of paper caused the value of the bank note to rise to 3*l.* 18*s.* 6*d.* in October 1816, and the exchange with Hamburg rose to 38. The bank had, on several occasions, intimated to the Government their perfect ability and readiness to resume cash payments, but had always been prevented from doing so for political reasons. But in November 1816 they had accumulated so much treasure that they gave notice that they were ready to pay off all their notes dated before the 1st January 1812, and in April 1817 all their notes dated before 1st January 1816. In October 1817 their cash had increased to 11,914,000*l.*, and the bank then said they were ready to pay off all their notes dated before 1st January 1817. The new coinage was issued in 1817. Thus the bank resumed payments in cash entirely of their own accord, without any legal compulsion, and, if it had not been for certain circumstances, they would have finally resumed cash payments in full without exciting any remark. But in 1817 Prussia, Austria, and other states contracted large loans in order to replace their depreciated paper with specie, which were largely taken up in this country. In April 1817 the Exchange began to fall, and the paper price of gold to rise. A steady demand for gold set in on the bank, and, in pursuance of its notices, 6,756,000*l.* was drawn out of it in gold. The British Government reduced its rate of interest on Exchequer bills, and the higher rate offered by foreign governments increased the demand for gold for export. The bank also increased its advances to Government from 20,000,000*l.* to 28,000,000*l.*, and the Country Bank issues increased by two-thirds since 1816. It was clear that the bank would be very soon drained of its cash, and on the 6th April 1819 an Act was passed to prohibit the bank from paying any cash at all. The Bullion Committees of the Lords and Commons were appointed. Ricardo had gained a considerable reputation, and he developed his scheme to these committees, and it was adopted by them, and an Act was passed to give it effect. He had previously shadowed out a plan by which no gold should be paid out of the bank except in bars of 60 ounces. The Act, commonly called Peel's Act, enacted (1) That the Acts for restraining cash payments should finally cease on May 1st 1823; (2) That between 1st February and 1st October 1820 any persons who presented notes to the bank of not less value than 60 ounces of gold might have payment of them in bars of standard gold bullion at the rate of 4*l.* 1*s.* per ounce. Between 1st October 1820

Mr. H. D. MacLeod.

16 March 1899.

and 1st May 1821 the rate was to be 3*l.* 19*s.* 6*d.* Between 1st May 1821 and 1st May 1823 the rate was to be 3*l.* 17*s.* 10½*d.* After that date payments were to be in gold coin. Numbers of persons, and apparently among them Mr. Lindsay, suppose that the bank subsequently resumed cash payments under this Act, but such an idea is erroneous. The fact was that this Act was a complete dead letter, it never had any operation at all. In August 1819 the paper price of gold fell to 3*l.* 17*s.* 10½*d.* The bank note was therefore at par. Consequently, nobody went to the bank to buy gold at 4*l.* 1*s.*, especially in such inconvenient quantities, when it was to be had in the open market at 3*l.* 17*s.* 10½*d.* Ricardo's scheme was therefore entirely inoperative, and a great nuisance for business. The bank then, in 1821, brought in a Bill of their own to enable them to resume cash payments. The Statute of 1821, c. 26, enacted that the bank might resume payments in cash on 1st May 1821. 2. *Scotch Banks.* The facts of the Scotch currency case, also cited by Mr. Lindsay, are simply these. The Bank of Scotland was founded in 1695 with a monopoly for 21 years, which expired in 1716, and it was not renewed. It had been extremely successful, and, as soon as its monopoly expired, many other banking companies started up, and among them its powerful rival the Royal Bank. All these banks were in a state of mutual hostility, and they sought to ruin each other. To guard against this, the Bank of Scotland introduced a clause into their notes making them payable on demand or at six months after sight, at the option of the directors. All the other banks adopted the same plan. The consequence was that the whole of the Scotch notes were practically inconvertible for six months. The Scotch exchange fell 4 per cent., and all the coin was exported. At last the two principal banks agreed to combine their influence to put an end to this nuisance. At their instance the Act 1765, c. 49, was passed suppressing all notes under 20*s.* and prohibiting these being issued with the optional clause, and making all notes payable to bearer on demand. In consequence of this, silver at once returned into circulation, and since then the Scottish currency has never varied from par. It is impossible to see what support this case lends to Mr. Lindsay's scheme. Neither of these cases, therefore, lends the least support to Mr. Lindsay's scheme. Mr. Lindsay seems to think that Ricardo's scheme might be made permanent so as to establish a gold standard without a gold currency. But Ricardo's scheme did not prevent a gold coinage, for during the time it remained on the Statute Book the gold coinage of 1817 was in circulation throughout the country, and was nothing but a nuisance, and it was got rid of as quickly as possible. To suppose that such a measure should ever be adopted as a permanent system is to my mind a pure delusion. Mr. Turner, a director of the bank, said in a pamphlet, "With regard to the "effect of Mr. Peel's Bill on the Bank of England, "I can state from having been in the direction during "the last two years that it has been altogether a dead "letter. It has neither accelerated nor retarded the "return to cash payments." The only other part of Mr. Lindsay's evidence that I think necessary to refer to is that he has given a strong opinion that the whole silver currency should be convertible into gold at the will of the holder. I should like to be allowed to make some remarks on this point.

12,938. What have you to say on the convertibility of the rupee into gold?—I am greatly surprised that some persons have given it as their opinion that, in order to maintain a par with gold, it is necessary that the rupee should be convertible into gold at the will of the holder. If such an idea were to be adopted, it would simply mean that a gold currency could never be restored to India. Suppose that the Government had many and wealthy enemies, as it might easily have. Suppose that these wealthy enemies conspired to collect 50 crores of rupees—which they might easily do—and suddenly presented them at the Treasury and demanded gold for them. The Government would simply be bankrupt, no Government would ever dare to restore a gold currency to India if it were called upon to face such a liability. Nor in any country in the world are gold and silver convertible into each other. In India itself the gold and silver coins were never convertible into each other. They circulated independently according to the estimation of the natives. In England, if persons accumulated 20 million shillings, they could not compel the Bank of England to give gold for them. Nor in France is the Bank of France bound to give gold for 25 million francs. So also in Germany, the United States, and every other country in the world. Paper currency is a promise to pay in coin, and consequently must always be redeemable in coin on demand, to be kept at par with coin. But in no country whatever are gold and silver convertible into each other. The way that shillings, francs, marks, &c., are kept on a par with gold is—(1) that they are strictly limited in quantity and cannot be increased in amount at the will of private persons; (2) then they are declared to be equivalent to gold as tender to a certain amount in payment of debts and taxes. That is all that is necessary to maintain subsidiary token coins at a par with the standard coin, as is evidenced in the cases of England, France, Germany, &c.

12,939. If there were a gold currency in India, do you contemplate that it would be in danger of disappearing into hoards?—It has been urged that the natives are so given to hoarding that, if a gold currency were restored to India, it would immediately disappear from circulation and be hoarded away. Such an idea, in my opinion, is purely imaginary. Persons who urge this seem to be oblivious that, with all the inveterate desire of the natives to hoard, there is an immense silver currency in India at the present time, estimated I believe at about 110,000,000*l.* They seem also to be oblivious that, though the natives from the earliest antiquity were given to hoarding, there was until the 1st January 1853 an immense gold currency in India — estimated at 120,000,000*l.* Though Lord Dalhousie's notification deprived this vast gold currency of its quality of legal tender, yet it was shown in the Parliamentary Paper of 1865 that sovereigns circulated to an immense extent throughout all India by the free consent of the natives, and were most popular among the natives; and that they had established a gold bar currency among themselves. Notwithstanding all the predilections of the natives for hoarding, a certain amount of money in circulation is indispensable for the business of life, and, as it was in the past, so will it be in the future. Let me put the case to yourselves. You receive perhaps 1,000*l.* as part of your income. You spend what you may want, and then you hoard away the rest—not in your own houses, but you pay it into your banking account. That is, you hoard it away at your bankers, and draw forth from time to time what you may require. But the natives of India do not trust their bankers. They are their own bankers and they draw forth from their hoards whatever they may want from time to time, just as you do here. There is no more danger from hoarding in India than from hoarding here. The danger, therefore, is purely fanciful.

12,940. What have you to say as to the rupee being a legal tender?—It will be seen in the Parliamentary Paper of 1865, which I have cited, that Mr. Parry of the Delhi Bank had, under instructions, taken the opinion of the leading merchants and bankers, and that they had no doubt of the success of the restoration of the gold currency to India, with the sovereign as the standard coin. One native banker, who had agencies in every large town in India, said that silver should only be legalised as payment for fractional parts of a sovereign. This, in my opinion, is far too extreme a measure to be taken at present, or at once. In my opinion, the silver rupee should be maintained as unlimited legal tender for a considerable time until India is sufficiently saturated with gold. When that is done, I think that silver should

be restricted as legal tender to an amount considerably exceeding the largest transactions of the poorer natives—say, 25*l.* Then, as the natives would perceive the great advantage of having gold coins instead of cumbrous silver coins, I think that the limit of silver as legal tender should from time to time be cautiously and gradually reduced till it reached a minimum. Sir Edgar Vincent said that silver was restricted in Egypt to 5*l.* as legal tender. I think that this limit—or perhaps, say, 10*l.*—might ultimately be reached in India. There is no doubt that, by the increase of industry in various forms which is now so rapidly progressing in every part of India, the natives will become richer, and Indians like all other people will prefer to have a sovereign rather than 15 rupees. However, all such steps must be taken cautiously and gradually by the Indian Government at its own discretion, and accordingly, as gold comes into general circulation, the Government should reduce the legal tender of silver until they reach the limit they think best suited for the country.

12,941. Assuming that a gold currency is introduced into India, at what rate do you consider the rupee should be taken?—As a matter of pure economics, the mints being closed to the free coinage of silver, the Government might fix the rating at anything they please. They might fix it at 10 rupees to the sovereign. But whether it would be expedient to go back to the rate of 1864 is quite another question. Mr. Hollingbery warned the Government in 1875 that they would find the restoration of the gold currency to be quite inevitable, and, the longer they delayed it, they would find greater difficulties, embarrassments, and expense in doing so. And Mr. Hollingbery's warning has been fully justified. When a government persists in a course of economic error, a certain number of persons make profits out of these errors, and it is only human nature that they should strenuously resist reform. This has been the case in India. During the continuous fall of the rupee since 1864 a large number of conflicting interests have grown up in India, and, though it is quite in accordance with economic theory that the sovereign should be rated at 10 rupees, it would practically be impossible to do so with regard to existing interests. I think that it is the duty of the Government to fix the rating of the sovereign to the rupee after due consideration of all the circumstances of the case. Still, a private inquirer like myself may offer a suggestion. I have therefore carefully studied the opinions of distinguished persons, and I find that there is a general consensus of opinion that the rupee should be rated at 1*s.* 4*d.* or 15 rupees to the sovereign. In favour of this course it is to be observed that the exchanges have continued very closely at this rating. During the continuance of this exchange a vast number of contracts must have been created, and officials of high eminence have testified that such a rating would be in no way injurious to agriculture. Of course, the matter must be a compromise between conflicting interests, but from all the reading and reflection I have given to it it seems to me that the rating of the rupee at 1*s.* 4*d.*, or 15 to the sovereign, is the most expedient under the circumstances and would cause less disturbance of private interests than any other. It would also be an advantage that this rating is most in harmony with the monetary system of England, because under it the anna becomes the penny, and the sovereign would be 240 annas—which would greatly facilitate accounts between England and India.

12,942. Is it essential that this rating should be declared forthwith?—I consider that this rating should be adopted simultaneously with declaring the sovereign legal tender throughout India.

12,943. Do you consider that it is possible to find what has been described as a "natural rate" for the rupee as measured by sterling?—There is no fixed "natural rate" between gold and silver or between any two quantities whatever. The "natural rate" between gold and silver is simply the market rate for the time being under the general law of supply and demand. It has been shown by a series of the most illustrious economists for 500 years, and confirmed by the experience of the Indian Government in 1806, that this is the fatal and invincible objection to bimetalism. It is absolutely impossible to control the fluctuating market value of gold and silver, and, coins being nothing but pieces of bullion with a stamp on them, which in no way affects their value, the coins must follow the value of the bullion of which they are made. And, consequently, it is impossible to preserve a fixed value between the coins, when it is impossible to control the fluctuations in the value of the metals they are made of.

12,944. What practical steps should you propose in order to establish now a gold currency in India?—Having thus, I venture to hope, cleared away all objections to the restoration of a gold currency to India, I will now submit to you the steps I should suggest to carry such a thing into effect——

12,945. (*Mr. Le Marchant.*) Do you mean a gold currency, or a gold standard?—You cannot have one without the other; I cannot imagine their being separate.

12,946. (*Sir F. Mowatt.*) Then we may read your answer, "Gold standard and gold currency"?—Yes, I cannot imagine a gold standard without a gold currency. Then the steps I would suggest are:—(1.) That the sovereign should be at once declared unlimited legal tender throughout India at the rate of 15 rupees to the sovereign. (2.) That, in terms of the Coinage Act of 1870, c. 10, the Indian mints should be declared to be branches of the Royal Mint in London, as the Australian mints are. (3.) That the Indian mints should be at once authorised to coin sovereigns and half-sovereigns of exactly the same weight and fineness as British sovereigns and half-sovereigns.

12,947. (*Sir A. Dent.*) That would be a branch of the Home Mint?—A branch of the Royal Mint, just as the Australian mints are branches of our Mint here. That the Indian sovereigns and half-sovereigns should have free circulation, and be unlimited legal tender throughout the Empire. (4.) That the Indian mints should be furnished with the necessary machinery to carry this resolve into effect as speedily as can be done. (5.) That every person who brings gold to the mints should be entitled to have it coined into sovereigns and half-sovereigns, as he may prefer, free of any cost or charge, at the mint price of 3*l.* 17*s.* 10½*d.* per ounce. (6.) That the Government should keep the coinage of silver entirely in its own hands. The Government can then extend or restrict the coinage of silver, as it may deem necessary and expedient for the wants of the people. (7.) That silver rupees should, for the present, remain unlimited legal tender until the Government deems it expedient to restrict silver as legal tender. (8.) That, so long as silver remains unlimited legal tender, the India Council Bills should be payable in gold or silver, at the legal fixed rating, at the option of the Government. (9.) That, so long as silver remains unlimited legal tender, all mercantile bills and other obligations should be payable in gold or silver at the legal rating at the option of the obligor. (10.) That, in case the Government should deem it expedient to restrict the amount of silver as legal tender, all the obligations above mentioned, Council bills, mercantile bills, and other obligations, should only be payable at the option of the obligor to the amount in silver declared to be legal tender. Then, as to the means of procuring a supply of gold. As a means of procuring the necessary supply of gold, I suggest:—(1.) That, after a fixed time, giving ample time to importers to make preparation, all customs duties in India should be paid in gold, or the equivalent of gold, such as cheques payable in gold. (2.) Considerable and increasing quantities of gold are now produced from Indian mines. These mines have only been opened within a comparatively recent time, but several of them are already very prosperous. The

Mr. H. D. MacLeod.

16 March 1899.

mining companies send all their gold to London to be sold for what it will fetch, thus incurring losses from freight, insurance, and loss of interest. If the Indian mints were opened to the free coinage of gold, the companies would naturally send their gold to be coined at the Indian mints and so save freight, insurance, and loss of interest, and greatly tend to increase the circulation of gold in India. Some of these mines have quadrupled their output since 1892. I have been informed that there are known to be extensive gold-bearing tracts that have not yet been touched; and new companies are frequently being formed. (3.) I cannot say whether sovereigns are held at the present day by the natives in such large amounts as was proved in 1864. But it is certain that there is now a very considerable amount of sovereigns in India. During the last year it is stated that 100,000 sovereigns were sent to the mint at Calcutta, and 40,000 to the mint of Bombay. If the sovereign were declared unlimited legal tender, it can scarcely be doubted but that considerable quantities of sovereigns would come out of their hiding places and be restored to circulation. (4.) For thousands of years until the 1st January 1853 India possessed an immense gold currency. At the latter date it consisted of a great variety of native gold coins and the Company's gold rupees. Up till the 1st January 1853 all this gold currency was received at the public treasuries and in payment of taxes at its market value in silver rupees. There must be beyond all doubt a very considerable amount of this gold currency estimated at 120,000,000*l.* still in existence. I suggest that all this gold currency should at once be restored to circulation at its exact equivalent value in sovereigns. I suggest that the Indian Government should publish a tariff stating the exact value of each of these gold coins in relation to the sovereign, and that they should all be received at the public treasuries and in payment of taxes and private debts at their Government valuation. I suggest that all sums received at the public treasuries and in payment of taxes should at once be sent to the mints to be coined into sovereigns and half sovereigns. By this means these gold coins would gradually disappear from circulation and be replaced by sovereigns and half sovereigns, and it would be a great convenience to the Indian community to have a uniform coinage instead of a vast multiplicity of native coins of different weights and fineness. Besides the actual coins it is known that immense amounts of gold are hoarded away or worn as personal ornaments by the natives. Persons of high authority estimate it at not less than 300,000,000*l.* But all such estimates are purely conjectural. All that can be said for certain is that it is something enormous. It is a notorious fact that for thousands of years the precious metals have been pouring into India. Besides the accumulations of former years, it is an official fact that since 1835 to the present time the net imports of gold into India exceed 160,000,000*l.* Lord Rothschild said in his evidence that in the course of a few years he had imported 5,000,000*l.* of gold into India in the form of bars which the native bankers hold as reserves. The practice alluded to in the Parliamentary Paper, that the natives established a gold currency among themselves of bars stamped by the Bombay banks, still continues in full vigour at the present day. The wealthy bankers of Calcutta, Bombay, and Madras hold large reserves in bars of gold and silver bullion. I think that the Government might greatly encourage the natives to bring their hoarded gold and personal ornaments to the mints to be coined, by offering them a slight advantage for doing so. I cannot doubt that, if the natives could have their hoarded gold coined into sovereigns and half sovereigns, especially on receiving a small reward, they would greatly prefer them to their equivalent in rupees, and thus a great gold currency would be restored to India as of old, and in this opinion Mr. Lindsay thoroughly concurs.

12,948. (*Sir F. Mowatt.*) That means that gold would come out of hoards?—Yes.

12,949. And would take its place as currency?—Yes.

12,950. It would replace an equivalent amount of rupees?—Yes.

12,951. Would those rupees go into the hoards instead of gold?—Yes.

12,952. You do not contemplate an increase in the general body of currency?—No. I should leave that to the operation of natural circumstances. Mr. Lindsay thoroughly concurs in the opinion that, if the natives had a chance of doing it, they would do it.

12,953. I was asking you whether you contemplated that the result would be to increase the total currency of India, or simply to substitute the sovereigns that come out of hoards for the rupees that went into the hoards?—It would be a very gradual operation.

12,954. (*Sir A. Dent.*) All that would happen in the first instance would be this: a man first of all would turn his gold bars into sovereigns?—Yes.

12,955. When he has got the sovereigns he would be *in statu quo;* he has got sovereigns instead of gold bars?—That is all.

12,956. (*Sir F. Mowatt.*) But I understand that, having got these sovereigns, they would not in your view remain in hoard, but would come out and go into the currency?—Yes. If you read the evidence, you will see that it is overwhelming to that effect. The poorest natives of India are obliged to put up with silver because they cannot do anything else, but the evidence is overwhelming that the natives who can afford it prefer gold to silver, and very naturally so; everybody else does. I suggest that the Indian Government should enter into negotiations with the native Princes, and endeavour to persuade them to adopt the sovereign as their standard unit. I am persuaded they would soon be brought to perceive its advantages. It would unify the monetary system of India and greatly facilitate commerce between the native States and the British Dominions. I am pleased to observe that three native States have already come under this arrangement, and I am persuaded that, if its advantages were prominently brought before them, many other States would gradually follow. I observe in a telegram from Melbourne of February 1st that within a short time upwards of a million in gold had been sent from Melbourne to India. If the sovereign were declared legal tender in India, there would undoubtedly be a large flow of Australian gold into India.

12,957. Then, generally, how do you sum up the advantages of these proposals?—In my opinion, the proposals I suggest would have these advantages: (1.) A permanently stable exchange being established between England and India, and the exchanges being always favourable to India, except perhaps in a few isolated cases, the Government would always make a profit on its bills instead of a loss. (2.) The restoration of a gold currency would put an end to fluctuations in the exchange, and, therefore, to speculations in the exchanges. (3.) It has been urged, and not without reason, that the closing of the mints to the free coinage of silver has been a hardship to the natives, as they are not now able to convert their hoarded silver and personal ornaments into rupees in case of necessity. It is, however, an undoubted fact that the natives prefer to have the greater part of their hoardings and personal ornaments in gold rather than in silver, when they are able to do so, and the increasing premium on gold, as compared with silver, has greatly promoted the hoarding of gold. If the mints were opened to the free coinage of gold, the alleged hardship of closing them to silver would be entirely obviated. (4.) They would leave the present rupee currency absolutely untouched. (5.) They would supply a mass of gold many times exceeding the quantity required to restore the ardently desired gold currency from the gold already existing in India itself, without the necessity of seeking an ounce from any foreign market. (6.) They would

tend greatly to increase the commerce between India and all other departments of the Empire, especially Australia, and also other gold-using countries. (7.) They will retrieve, as far as can be done, the lamentable error of Lord Dalhousie in demonetising the immense gold currency of India, and the lamentable error of the Indian and Home Governments in 1864 in failing to close the mints to the free coinage of silver, and so re-establishing the gold currency in that year at the fixed rate of 10 rupees to the sovereign—which have been the causes of the monetary troubles which have so long afflicted the country. (8.) They would establish a solid and permanent monetary system in India for ever, on exactly the same lines as the British system, which is now universally recognised as the most perfect system ever devised by the ingenuity of man, and which has now been adopted by an increasing number of civilised Governments. (9.) When this system is once fairly established, it will be possible to improve the banking and paper currency system of India, which is now in a very crude and undeveloped state, and which greatly needs reform to meet the growing industrial and commercial wants of India. (10.) They would greatly tend to consolidate the Empire, by adopting the same standard unit throughout its extent.

12,958. If the favourable conditions which have maintained a 1*s.* 4*d.* exchange should cease, temporarily or otherwise, would not the existing stock of rupees tend to be in excess of the volume required for the fixed rating of 1*s.* 4*d.*?—Not after the gold currency has once been established and the exchange settled in gold. The state of the exchange depends exclusively on the state of the coin, or other medium in which they are settled, and is in no way affected by the depreciation or bad state of any other coins or media used used for internal circulation. Several striking instances of this may be given. (1.) During the great re-coinage in 1693 the Bank of England stopped payment. The only medium of settling the exchanges was bank notes. The bank notes fell to a very heavy discount—25 per cent. The exchange with Holland accordingly fell 25 per cent. But in July 1696 the new silver coin came out, and the exchanges which were paid in it immediately rose to par, while for 15 months after that the bank note was at a discount of as much as 24 per cent., and was not brought to par till October 1697. Thus the heavy discount of the bank note had no effect on the exchanges when the good silver coin was brought into circulation. (2.) In 1717 Parliament enacted that guineas should be legal tender for 21*s.*, when Sir Isaac Newton had shown that they were only worth 20*s.* 8*d.* Guineas were thus overvalued by 4*d.* That over-rating of the guinea caused the whole of the good silver to disappear. Gold being the cheaper metal, it was settled among merchants that all bills of exchange should be paid in gold. Although the legal standard was silver, merchants, by custom, made the exchanges payable in gold. Thus it was the Bimetallic Law of 1717 which made gold become the practical standard in England. Thus the Bimetallic Law of 1717 produced monometallism in England as it has done in every instance in history. (3.) The present silver coinages of England, France, and Germany are not worth their legal rating by more than 50 per cent.; and yet this depreciated subsidiary currency has no effect whatever on the exchanges, because they are settled in gold.

12,959. Then, under those circumstances, there is no need, I think, to ask you the further question—whether you would take any steps to meet any such future possibility, because you have practically answered that in the negative in your answer to the last question?—I say it is possible that the dangers set forth here might occur—I do not say they will, but it is possible they might occur during the transition from silver to gold. Therefore, my obvious answer is, accelerate the transition from silver to gold as fast as ever you can. After you have settled it, as I say, nothing that touches the rupee can affect the exchanges, which are always settled in gold.

12,960. (*Mr. Le Marchant.*) You were saying, if I understood you rightly, that convertibility was not necessary to maintain the par between rupees and sovereigns. Are you assuming a favourable condition of foreign trade? Supposing the balance of payments were against India, would not the tendency be for a premium on gold to come into existence?—But if the exchanges are settled in gold, the rupees would not come into the case at all—just as here the English exchanges are settled in gold, and the value of a shilling, which is not really worth more than about 5*d.*, does not affect the exchanges.

12,961. Would not that depend upon the proportion between the amount of rupees and the gold in circulation?—I do not think so.

12,962. You would regard the exchange between England and India as being stated in terms of gold?—Purely in terms of gold. In no country in the world is silver convertible into gold at the will of the holder. In France the exchanges are always at par, because all the French exchanges are in gold, and the enormous five franc currency that there is in France does not affect the exchange a bit.

12,963. Practically, in France it is always possible to get gold at the Bank of France?—By paying a premium.

12,964. In certain cases only?—I am not sure, but I think it is absolutely at the will of the Bank of France whether it pays drafts upon it in gold or silver.

12,965. It is certainly at their discretion, but, as a matter of practice, it is possible to get gold?—Yes, but they always exact a premium for it. That, however, does not affect the exchange.

12,966. But the exchange on Paris did vary in very close correspondence with the premium on gold recently?—I daresay you have gone into that more than I have. When a coin goes to a premium it disappears from the general circulation.

12,967. There would necessarily be a tendency, would there not, for gold to leave India at times for remittance purposes?—Those are the cross operations of banking.

12,968. You proposed to offer a bonus upon gold paid in by natives of India, giving them some advantage?—Yes, my fixed idea is this, that—not too suddenly—you should facilitate the restoration of the gold currency. I think, if you gave a small premium, say, perhaps, 2 or 3 per cent., you would have natives bringing their ornaments, their vases, and so forth, out to be coined.

12,969. Would you, at the same time, be giving a different rate at the Mint? Take the rate at the Mint as being, for argument's sake, 15 rupees to the sovereign; would you propose a different rate for gold brought to the Treasuries?—I think it would induce people to bring out gold which they otherwise would not do, but it is just an idea thrown out.

12,970. You speak of accelerating the transition from silver to gold. A good deal would depend on the rapidity with which that could be effected, would it not?—Yes. I would not borrow 50 millions, as has been talked of here; I would let the operation of natural causes act in India itself. I would send this out by telegraph to-morrow, simply to declare the rupee legal tender at 1*s.* 4*d.*—nothing else for the present—just to bring it out into circulation, which would be gradual.

12,971. You would contemplate an interval of possibly some years?—No, I do not contemplate an interval of years.

12,972. Can you say anything as to the time in which those measures would effectively establish the gold standard?—That would depend greatly on the energy with which the Government took up the question. All I say is that it would have to be a gradual thing.

12,973. Can you give any notion of the period at which the transition might be completed?—I cannot

Mr. H. D. MacLeod.

16 March 1899.

conceive that, if the Government are really in earnest and put their hearts into it, and especially get the banks to assist them—if it was the settled policy of the Government, I am sure the great Indian banks would come into it—I do not see why it should not all be done in two years. Then, I do not propose to limit the legal tender of the rupee at present. I would leave it perfectly untouched, and simply gradually introduce a gold currency in addition to that.

12,974. You suggested making Customs duties payable in gold. Would importers have any greater facilities for getting gold than the Government themselves?—Importers must pay their dues, and it is quite easy for them to avoid silver. That is one of the ways I should take to restore a gold standard. In Russia all the import duties are payable in gold.

12,975. But the importer would have to buy it in the market?—But he would have to buy silver. It does not matter to him whether he buys silver or gold.

12,976. Unless there were a difference of price?—Suppose the price of the sovereign is fixed at 15 rupees, is it not the same thing to him whether he gets gold or silver?

12,977. If he can buy it at the same price; but that might not be the case at first?—I want nothing violent. I want a certain end in view, and to pursue it gradually. You might give them a little time to arrange matters. It is done here; so it is in Russia. I do not know how it is in France. In Russia, certainly, it is done.

12,978. With regard to a tariff of the existing gold coins in India, would you base that entirely on the weight of fine gold in the coins, taking it in exact proportion to the fine weight of the sovereign?—Quite so. That is the way that all coins are measured, by the quantity of fine metal in them.

12,979. I think in your work on bimetallism you made some suggestion about giving a market rate for gold coins if brought in?—No, that was the old custom when the Indian Government finally abandoned bimetallism as hopeless in 1835, quite ignoring their Minute of 1806, which utterly condemned bimetallism. They said that silver rupees should be the sole legal tender throughout India, but that all the ancient gold coins should be received at the public treasuries at their market value in silver.

12,980. But I thought at one time you proposed adopting the same measure again as an inducement to the holders of gold to bring it in?—No, I do not think so, because I want everything to be brought into connection with the gold standard—with the sovereign.

12,981. At a fixed rate?—At the rate of pure metal. Formerly gold coins were received at their market value in silver. Now I want them received at their strict relation to the sovereign. This would make the currency of a uniform value.

12,982. (*Sir A. Dent.*) I did not quite understand what you said about mercantile bills being payable in gold or silver at the option of the obligor. Will you explain that a little more fully?—Suppose I have your bill for 100*l.*; suppose I demand gold; it may be very inconvenient to you; or I might demand silver and you might not have it. Now, it is the same to me whether you pay me in gold or silver—whether you pay me in two sovereigns or forty shillings; either would be perfectly good for me; whereas it might be inconvenient to you to compel you to pay one or the other.

12,983. But, if I owed you 100,000*l.*, it would be very kind of you to let me pay the 100,000*l.* or its equivalent in shillings?—Exceedingly so.

12,984. I do not know how that would work. I might turn that to my advantage surely?—The rupees at 1*s.* 4*d.* are the legal equivalent, just as shillings are here. What does it matter whether you pay two sovereigns or forty shillings?

12,985. Because I can always get rid of forty shillings, but I cannot always get rid of 400,000 shillings?—But the same principle applies. It would be very inconvenient if a lot of people could press the Government for a particular metal. I would give the Government the option to pay which it liked, they should have their option entirely.

The witness withdrew.

Adjourned.

THIRTY-THIRD DAY.

Friday, 17th March, 1899.

PRESENT:

THE RIGHT HON. SIR HENRY H. FOWLER, G.C.S.I., M.P., IN THE CHAIR.

Sir FRANCIS MOWATT, K.C.B.
Sir DAVID BARBOUR, K.C.S.I.
Sir CHARLES CROSTHWAITE, K.C.S.I.
Sir ALFRED DENT, K.C.M.G.
Mr. ROBERT CAMPBELL.
Mr. W. H. HOLLAND, M.P.
Mr. F. C. LE MARCHANT.

Mr. ROBERT CHALMERS, *Secretary*.

Rt. Hon. L. H. Courtney, M.P.

17 March 1899.

The Right Hon. LEONARD H. COURTNEY, M.P., called and examined.

12,986. (*Chairman.*) You wish to call attention to the questions that were submitted to the Herschell Committee?—Yes. I think, so far as I understand the scope of your inquiry, it is essential that you should first examine, as doubtless you have, what the Herschell Committee was called upon to do and what it did. It is upon the results of the action consequent on the report of that committee that you now stand, and from that standpoint you have to face the future. It appears to me necessary that you should realise the past, and, although probably I shall say nothing but what you have already had before you, I think it better to begin by saying that. The situation at the time when the Herschell Committee was appointed may be shortly said to be this: that all classes interested in trade and commerce in India were very much embarrassed by the divergence—the uncertain and, as it proved, the growing divergence—between silver and

gold. The instability of ratio baffled all calculation; people did not know when they entered into a transaction what would be the result when the transaction came to be completed. But, in addition to that, the real motive cause of the appointment of the committee was the great embarrassment to the Finance department of the Indian Government. The fall in the value of the rupee in relation to the pound sterling produced great and repeated deficits in the Indian finances, and the Finance Minister did not see his way to any mode of filling that deficit by the imposition of taxes. And, moreover, there was a danger that that deficit might be increased, so that any step taken to cure it for a particular time might be insufficient in the course of a year or two. Moreover, at the time of the appointment of the committee there was an imminent danger, which was, in fact, soon after realised, of a change of action on the part of the American Government and Congress, which would lessen the consumption and coinage of silver within the United States, and so probably increase the divergence between silver and gold, making India almost the only open ground for the reception of the silver that was being mined. This very much alarmed the Indian Government. It was urged on the Indian Government that the only way of settling this difficulty once and for all was to close the Indian mints; and the Indian Secretary consulted Lord Herschell and his colleagues as to whether it would be justifiable to reject that proposal.

12,987. I think I ought to ask you this question now, because Sir David Barbour, who was then the Indian Minister, as one of our body. The proposals of the Indian Government were not only to stop the coinage of silver in the Indian mints, but they also proposed the introduction of a gold standard, and that step was a preliminary to the introduction of a gold standard?—You have the words before you. I do not think the terms of the reference to the Herschell Committee included that. It was only with reference to that possibility.

12,988. No, it was a little more than that. I will read you the words:—"I enclose for your Lordship's "perusal a copy of the correspondence which has "recently passed between the Secretary of State for "India in Council and the Government of India, in "which, as you will observe, that Government sub-"mits proposals for stopping the free coinage of "silver in India, with a view to the introduction of a "gold standard." So that it was not simply an enquiry as to the closing of the mints?—That was within the view, no doubt, of the Indian Government, but the actual question which we were called upon to decide was whether the Home Government would be justified in rejecting that propcsal; if we could not advise a rejection, could we offer any suggestions as to what would accompany the closing of the mints? I think the first part of our answer was restricted to the reply that we could not advise the Indian Secretary to reject the proposal of the Indian Government, and we went on to say that, if the mints were closed, we thought it should be accompanied by a declaration on the part of the Indian Government that they would be prepared to receive gold, and to give out rupees in exchange for gold, at the several treasuries and elsewhere that they might appoint, at the rate of 15 rupees to the sovereign.

12,989. We had better just get upon our notes the exact terms of the recommendation. The exact recommendation of the Committee, which was signed by every member of the Committee except Lord Herschell (who, of course, did not sign it because he was a member of the Government who would have to consider the report, although he concurred in it), is this:—"It remains for us to state the conclusions at "which we have arrived. While conscious of the "gravity of the suggestion, we cannot, in view of the "serious evils with which the Government of India "may at any time be confronted, if matters are left as "they are, advise your Lordship to overrule the pro-"posals for the closing of the mints and the adoption "of a gold standard, which that Government, with "their responsibility and deep interest in the success "of the measures suggested, have submitted to you. "But we consider that the following modifications of "these proposals are advisable. The closing of the "mints against the free coinage of silver should be "accompanied by an announcement that, though "closed to the public, they will be used by Govern-"ment for the coinage of rupees in exchange for gold, "at a ratio to be then fixed, say 1*s.* 4*d.* per rupee, "and that at the Government treasuries gold will be "received in satisfaction of public dues at the same "ratio." Those are the words?—Yes.

12,990. You consider that that was what you all agreed upon?—We all agreed upon that.

12,991. There was a difference of opinion about the 1*s.* 4*d.* was there not?—I think Mr. Currie had some notion as to the fixity of 1*s.* 4*d.* or as to the permanency of it rather.

12,992. And Lord Farrer and Sir Reginald Welby "could not join in the recommendation contained in "the Report without at the same time recommending "that the Government of India should, in view of the "ultimate adoption of the whole of their plan, be "prepared to secure the convertibility of their token "silver currency and should with that object "accumulate a sufficient reserve of gold"?—Yes, those two members did join in that. I do not remember now whether I saw their recommendation; perhaps I did.

12,993. You did not sign it at all events?—Oh no, I dissented from it entirely then, and have done ever since.

12,994. What has been the result of that policy?—In my view the result has entirely justified the action then taken. It has secured the ends that we had in view. It has established practically by degrees—by a slow process, but it could not be done at once—what I think may be trusted as a stationary ratio between the rupee and the sovereign, and that stationary ratio is 1*s.* 4*d.* In consequence of the other steps that we recommended at the time, that has operated in the way of removing, except under extraordinary circumstances, the perennial deficit and the danger of the deficit coming on the Indian Finance Minister without any warning from causes over which he has no control whatever. He has now, like every other Finance minister, to face the possibility of deficits, but they will not arise in my view from any depreciation of the rupee in the near future.

12,995. You regard that figure of 1*s.* 4*d.* as practically stationary?—I regard that figure as practically stationary.

12,996. Will you tell us what you think are the reasons why it has risen to that figure?—I contemplated from the first that there would be a gradual rise to that figure and that we should see in India experiences analogous to what we were called upon to watch in other countries in the course of our investigations. For example, the rise in the value of the paper currency in the United States after the great war. It took some time to rise, but it rose practically from no contraction, as far as I remember—very little contraction—of the mass of currency, but, the amount being fixed in substance, the growth of transactions of the United States, which is, of course, very much more rapid and of much greater elasticity than the transactions in India could possibly be, had risen to the level requiring, you may say, the quantity of currency which was found in circulation, and that currency obtained in that way a par relation to the gold it represented.

12,997. It would be a legitimate contraction of the currency you mean?—It would not be an absolute contraction in itself. Relatively it would be a contraction, because the amount of the currency would diminish in proportion to the growth of the transactions which it had to carry.

12,998. But how would that affect this possibility? Taking your own words you say, "No addition "has been made to the amount in circulation, and with "wear and tear on one side and increasing transactions

Rt. Hon. L. H. Courtney, M.P.

17 March 1899.

"on the other we have arrived at the 1*s.* 4*d.*" Now assuming the wear and tear to go on, and the transactions to go on increasing, would there not then be a danger?—No. I consider that the action that we adopted would result in the introduction of supplementary gold currency, which would not get into common circulation, any more than 50*l.* notes are in common circulation in England, or even 5*l.* notes; they are not the circulation of the poor, but the gold would come into India and would form part, although comparatively a dormant part, of the actual currency of India as much as the rupees which are in circulation; and in my view the currency would go on receiving automatic accretions as the course of trade required.

12,999. (*Sir F. Mowatt.*) Your answer contemplates that the gold should be currency as well as standard?—I think that will follow from the usual habits and modes of living of men.

13,000. I mean, you are contemplating its passing into the coinage?—It is not at all necessary that the coins should be coined in India, although that might be advantageous. It is quite sufficient if a man in India with a sovereign in his pocket knows that he can get 15 rupees for it. When that gets to be present in the Indian mercantile mind, then the gold will come side by side with rupees.

13,001. (*Chairman.*) Any increase in the currency would be obtained by the issue of 15 rupees to the sovereign?—Quite so. Just as any actual increase of our silver coinage at home is obtained by getting a profit from the mint, so the rupees, to the profit of the Indian Government, could be coined when wanted, and, if the merchants want it, it will come.

13,002. The rupee would not go above 1*s.* 4*d.* as long as its intrinsic value is below that sum?—As long as its intrinsic value is below that sum it could not go above 1*s.* 4*d.*, and, as long as the Indian Government are ready to issue rupees in exchange for sovereigns at the rate of 15 rupees to the sovereign, that fixes the limit—the upper limit.

13,003. Do you think that, having regard to the value of 1*s.* 4*d.* being fixed in the way you have pointed out, we may look to the permanency of trade movements to keep it at that value?—I think we may. The thing that was borne in upon us by our investigations on the Herschell Committee was the extraordinary way in which trade movements and banking expansion did cause a level to be sustained for which apparently there was no adequate basis. That was not only the case in the United States, but it is the case in France. But what I would suggest to the Committee that they should consider here is the fact that our own silver coinage at home, although it is only legal tender to the extent of 2*l.*, is *de facto* perfectly good for paying all debts to any amount. I am open to be instructed in the matter, but within my experience I never heard of any banker objecting to receive from his customer in the way of business any amount of silver that that customer brought to him, and, if he receives silver indiscriminately and honours the cheques which are drawn against that silver, it is only a case of carrying the silver to the bank and drawing a cheque, and the banker will say, "how will you have it?" Then you take what you get in exchange for that cheque and pay your creditor, so that, although the creditor may absolutely refuse to take from you more than 2*l.* in silver, you always, without any limit so far as I know, use your silver through that one intermediary in the payment of any debt whatever.

13,004. Practically the silver in this country is convertible?—Just so.

13,005. It is not an inconvertible token coinage?—Just so, and the circumstance that it is not a legal tender beyond 2*l.* has nothing to do with that convertibility, that convertibility is quite independent of that. It depends on the fact that the Government does not issue it beyond what is wanted.

13,006. That is what keeps it within its proper bounds?—Yes.

13,007. (*Sir F. Mowatt.*) I understand that considerably larger sums than 2*l.* in silver are continually brought to the banks?—Oh, yes, certainly. Consider what kind of account an institution like the Crystal Palace would keep with its bank. My earliest practical years were spent in a country bank. There we received from our trade customers what they had received over the counter, a large proportion of which was silver. Silver, notes, or gold, it is all one; it goes in without any discrimination to your credit.

13,008. (*Chairman.*) My House of Commons experience, which is much shorter than yours, has been this; that where the Chancellor of the Exchequer has been exposed to pressure with reference to the coinage, has been in regard to the deficiency of silver?—Just so. I may mention a fact which is of some little interest. My earliest practical years were spent in a bank in Cornwall. We received silver from our customers, but the silver was always accumulating on our hands and we were continually obliged to send away for gold. The silver was a thing that we rather wanted to get rid of. Of course, in other parts of the country, bankers would have just the contrary experience. I believe in our case it was due in large measure to the fact that silver was wanted in that neighbourhood for the purpose of payment of miners' wages, whilst the commercial travellers and others who came down into that part of the country and supplied things, took away with them the gold with which they were paid, but did not take away the silver.

13,009. There is always a great demand in a manufacturing district every week or every fortnight for silver to pay wages?—Just so. Perhaps I may give another illustration which struck myself and some other members of our Committee very much in the course of our investigations. I refer to the experience of the Austrian Government. The currency of Austria was silver, but Austrian finances being in great straits, over and over again they had issued paper, and declared paper to be inconvertible, and the inconvertible paper fell below par in silver. Then, subsequently to 1873, silver became depreciated, and depreciated so that the silver was depreciated in reference to the paper, which before had been depreciated in reference to silver. The stationary paper of the Austrian Archduchy absolutely obtained a premium over the silver that it represented; and it never seems to have occurred to the Austrian Government that they could make a profit by bringing back their paper and putting out silver so as to maintain that par. But actually we had it well established that the inconvertible paper of Austria was at a premium in respect to the silver that it represented, that inconvertible paper for many years past not being subject to any increase.

13,010. Is it not so now in the case of Russia?—It may be. That illustrates the proposition I am laying down, that an apparently arbitrary quantity of coinage in circulation can be maintained, under circumstances where one would have thought it impossible of realisation, at what has been called an arbitrary value.

13,011. That would lead you, I suppose, to the conclusion that the Indian currency is becoming more and more automatic under the present system?—I think it is.

13,012. There is, of course, a possibility that the rupee might fall?—It is impossible to say that it could not fall; it might fall under particular stress for a short time; it may certainly be said that it could not rise, and it may fall; it is impossible to deny that; but the experience of the countries to which I have referred induces me to believe that it could only fall temporarily, and that the fall would speedily be recovered. Our own past experiences would suggest that, if there happened to be an absolute scarcity of leading crops—want of exports for the whole 12 months—that might involve a temporary depreciation of the rupee in consequence of the necessity of finding something to pay outside debtors;

but I think that difficulty, if it does occur, could be met, and I really do not think it is a serious practical difficulty. It is a theoretical one rather than a practical one.

13,013. In this connexion would you say anything with reference to the French currency? As I understand, in France silver is legal tender to any amount?—Silver is legal tender to any amount.

13,014. And yet France assumes to have a gold standard?—That is so. The exchange between France and England is stationary. Of course it does fluctuate a little from day to day, but it is practically stationary, although silver is legal tender to any amount, and it is so because at present the coinage of silver is stopped, and it does not exceed what the trade of France will carry. Silver is to any extent legal tender in the United States.

13,015. There they have a gold standard?—There they have a gold standard.

13,016. Although Lord Aldenham yesterday told us that they had not?—Many of those controversies turn rather on the way in which you express facts, but as a matter of fact we, I suppose, may boast or confess that we have got a gold standard here, and I should say broadly that any country which maintained a permanent exchange with us had a gold standard too.

13,017. While we are upon this point we should like to have your view as to whether there is any difference, and, if so, what, as between the condition of India and France with reference to the possibility of a gold standard?—I do not know that there is any very great difference. The French Mint is open to gold.

13,018. And not to silver?—Not to silver, and that is practically the situation to which we have come in India. There may not be Indian mints open to gold, but, inasmuch as gold coined in England is receivable in India at a fixed relation to the rupee, it is the same thing. It is only the abolition of a little intervening space to realise an exact reproduction of the same state of things, and nothing turns upon that little intervening space.

13,019. Suppose we advance a step further. Leave silver in India unlimited tender, but also make gold a tender in India, and also make the sovereign by law equivalent to fifteen rupees; what would be the difference then?—I do not think there would be any, I should say substantially it would be a reproduction.

13,020. Is there any country which you can refer to, besides Austria and the United States and France; take the case of Russia, for instance?—I am not sufficiently acquainted with the exact situation in Russia now.

13,021. What do you say the Indian Government ought to do?—I should say, for the present at all events, and probably for a long time to come, they should do nothing, except to make it clear that they are going to maintain their present policy until some circumstances might happen, which later on I shall refer to; but at present I should say, do nothing at all.

13,022. Would you open the mints to the coinage of gold?—Yes. I consider that, although many regard it as an important fact, to be an unimportant fact. It may strike the imagination and bring it home to the people, but, if the Indian treasuries are open to the reception of gold, that is enough, it involves the other things. It is a mere matter of machinery, and I think it is probably very desirable as a matter of machinery that they should be open to gold.

13,023. I do not know whether you remember the proposition submitted to Sir Charles Wood for the reception of gold coinage in India?—That was with a view to displacing the then silver standard.

13,024. But there was a very strong opinion then on the part of the mercantile community in India that a gold currency would be popular, a great many representative bodies in India desired it?—Opinions, if I may say so with respect, appear to be generated pretty easily in India.

13,025. (*Sir F. Mowatt.*) When you say the Indian Government should express their determination to maintain their present policy, you include the gold standard as well as the closing of the mints?—We shall come to that presently, but I do regard the gold standard as established.

13,026. (*Chairman.*) For all practical purposes of internal trade in India—for the man in the street, and the man in the village, or the village shop, a gold coinage would be absolutely useless?—Oh yes.

13,027. A great portion of the transactions are carried on in copper?—Yes, annas and pice; but, as I said before, the 5*l.* note is not known to the agricultural labourer here.

13,028. Now, if the 1*s.* 4*d.* is represented, as it has been to us again and again, as an arbitrary amount, what is your answer to that?—I should say that that was selected at the time the Herschell Committee deliberated—it was probably produced by those who had it in their mind—as involving the least change consistently with satisfying what was desired, namely, the filling up of the deficit.

13,029. And avoiding additional taxation?—Avoiding additional taxation. It was a means of screwing up the rupee to a higher value, in order to get more money, as well as establishing that uniformity of exchange which was established.

13,030. Your opinion, I see, agrees with the opinion that has been expressed to us by commercial authorities, that the commercial relations between India and England have adjusted themselves now to the 1*s.* 4*d.*?—Yes, and will continue to adjust themselves. I think also I may say with respect to that question of the difficulties that may arise in remittances home from time to time, that those will be adjusted also by merchants and bankers without any call for interference on the part of the State. Our own history in the past has shown how merchants and bankers can effectuate, and have effectuated, exchanges and remittances from this country to other countries, whilst our own coinage and currency were in a deplorable condition, far below the security and stability now established in India.

13,031. You put it that a gold standard has been reached because the rupee has become equivalent to a certain proportion of the ounce of gold?—Yes. I say that the rupee now in India has practically become equivalent to the fifteenth part of a fraction which is represented by 20,000 divided by 77,875 of an ounce of gold.

13,032. Then, on the whole position of Indian finance at this moment, you would not take any further step?—No. If I were in the position of an Indian Finance Minister, I should hold my hand.

13,033. There have been several schemes put before us: Mr. Lindsay's scheme, Mr. Raphael's scheme, and the proposals, of course, of the Government of India. Have you considered those?—Yes, they are all illustrations, to my mind, of what I should call superfluous energy.

13,034. You do not believe in what is called the exchange standard?—I do not know that I understand what those words mean, but I do not believe in the necessity, or prudence, of the Indian Government undertaking to give gold in exchange for rupees; and all these schemes, as far as I understand them, are means to the result that not only shall the Indian Government be prepared to give rupees in exchange for gold, but that it shall be under an obligation to give gold in exchange for rupees.

13,035. That you do not approve of?—I do not approve of that. It is accepting an obligation which is entirely unnecessary. I cannot prefigure how much it would involve. It certainly involves some risks, which might be rather serious risks, of being on an inclined plane—you could not get back or prevent yourself from slipping lower and lower; and it does not promise any advantage which is worth the running of that risk. If I were an Indian Finance Minister, I would no more undertake to give gold in exchange for rupees than I would undertake, as

Rt. Hon. L. H. Courtney, M.P.

17 March 1899.

Chancellor of the Exchequer in this country, to give sovereigns in exchange for silver. Someone has said that that is an incomplete feature of our own currency system. I do not know that we have suffered from that incompleteness. We exist under it without any complaint.

13,036. I suppose the great danger would be that gold would be obtained for rupees for the purpose of hoarding. So far as commerce is concerned, as you have already said, that would adjust itself?—Yes.

13,037. The danger would be a drain of gold which would be taken out of circulation and accumulated in India?—Yes, there is that risk—a serious risk—but the great risk I feel is in the Government undertaking a supposed duty which they are not called upon to do, which is not wanted, and which might lead them into very serious financial embarrassment.

13,038. And that, if their policy was to proceed by degrees towards the gold standard, and even to an enlarged gold currency, that would be a premature step?—Yes. I think time would bring it about, and in the history of nations, a year, or even 20 years, is not a very considerable time.

13,039. Then I need hardly ask you this perhaps—you are not in favour of opening the mints now to silver?—If I were an Indian Finance Minister, I should not venture to look at it.

13,040. If you were a merchant, would you look at it?—No, I do not think so—that is under the present situation—by itself, as an independent act of an Indian Finance Minister.

13,041. It has been said that India must have the means of remitting home and elsewhere. What is your answer to that?—My answer is, looking back as I do upon our own experience, that Indian merchants and bankers will always find the means of sending home and elsewhere—that it will be established practically automatically.

13,042. Their remittances being really made in commodities?—They will be in commodities in the ordinary way. India has not been a sender home of bullion; in fact, the movement has always been the other way.

13,043. Last year we have had the experience of a famine, and this year we have had the experience of a bountiful harvest, and practically the result seems to be the same so far as regards steadiness of exchange?—Yes.

13,044. A great failure of crops might cause a temporary banking pressure?—I admit that.

13,045. But only in currency?—I think so.

13,046. Now what do you say as to the future?—So far I have spoken from the point of view of an Indian Finance Minister, whose first care is to balance his accounts, and also who has a desire incidentally to establish a stable ratio between the rupee and the sovereign. Both of them have been secured, but, of course, those benefits have been secured at a certain price. In the interval, as is necessarily the case in the transition from one condition to another, there is a good deal of friction and some suffering involved, but those have been overcome, and I do not think we need consider now that they involve any great further danger. But the action has been done, as I said before, by screwing up the rupee to a higher ratio in relation to the £. If there were any possibility, however remote, of the same stability of relation being established by bringing down the £ instead of screwing up the rupee, that is a contingency or possibility that an Indian Finance Minister ought never to lose sight of. The cheaper the £, the better for India, and the less the weight of the gold debt upon India; and it is most desirable in the interests of India itself that that should not by any possibility be neglected. If we carry our minds back to the time before 1873, at that time silver was freely coined in India; gold was freely coined in England; but there was practically perfect stability of exchange between England and India. If there was any possibility of reproducing that situation, I believe we should all confess that that would be better than the present state of things. If, by any chance, the rupee could be again one-tenth of a £, Indian finances would be better, the burden of taxation would be lighter, and the burden on Indian trade would be less than it is, provided that is done in such a way as not to go on screwing up the rupee again and again to the £, but by possibly, as it might happen under certain circumstances, bringing down the £ into relation to the rupee.

13,047. Do you mean by that a rise in the bullion value of the rupee?—A rise in the bullion value of the rupee. The change that has happened since 1873 was not due to any action of the Indian Government; it was not due to any action of the English Government; it was due to the action of other Governments. If the other Governments saw their way, or could be induced to see their way, or could be helped to see their way, to retrace the action which they took, we should get reproduced a situation very much better than the present, and the Indian Finance Minister ought never to shut his eyes to the possibility of that being done.

13,048. Would you go a step further and say that the Indian Finance Minister ought to see whether he could in any way accelerate that?—He should keep his eyes open and, if there is any opportunity given to him, he should seize upon it. Of course it may be said that the solution of which I am speaking is quite futile—that it is a matter of the past—but, if you look back upon the past and see what forces have been raised and have not yet entirely passed away, and if you look forward to the future, I should be slow to say that anything was out of the question in respect of gold and silver. We know that the shutting of the Indian mints was ultimately precipitated—you may say ultimately determined upon—under the shadow of the possibility of American action in refusing to coin silver. Now it will be quite possible that American action might cause a reopening of the mints.

13,049. In America do you mean?—No, in India. American action might facilitate or might occasion the reopening of the mints in India and an Indian Minister ought to view the possibility of American action. I will not say he could do anything at once, but he might express himself in a way which would perhaps tend to bring about American action which would be beneficial to himself, to his finances, and to India.

13,050. In the result, what you have just been saying would come to this, would it not, that, while you would not endanger the present equilibrium, you would keep your eyesopen to see whether anything might occur which might alter the conditions?—There might arise circumstances under which it would be impossible to maintain the present situation. If the intrinsic value of silver rose so that the value of the rupee got above the 15th part of that fraction of an ounce of gold, the Indian Government could no longer offer to give rupees in exchange for gold; it would be bound at once to stop that. If the value of silver rose so that the value of the rupee came to be above 1*s.* 4*d.*, the Indian Government must at once stop giving rupees in exchange for gold, otherwise it would have gold poured in upon it and silver going out. Therefore, in view of that, the Indian Finance Minister would be quite justified and perfectly safe in saying, if anything is done which should bring the rupee up to 1*s.* 4*d.*, "The situation is changed and I must take some action"; and he might say, "If you bring up the "rupee to 1*s.* 4*d.* I must stop the issue of gold and I "shall be prepared to re-open the mints to silver as "long as it is above 1*s.* 4*d.*, upon the understanding "that they are shut the moment there are any "signs of its going below 1*s.* 4*d.*"

13,051. But you would not deal with that at present; you would not say that now?—I should keep that rather in the back of my mind, as it were. To an American Minister who came suggesting that the coinage of silver might be renewed in America, if India showed any possibility of sustaining that action, I should say, "Well, if you make silver freely coinable

in America, which must produce at once a very great change in the relative value of silver to gold, and, if that change were such as to bring up the metal in the rupee to 1*s.* 4*d.*, then we shall be prepared to sustain it by opening our mints in the same way."

13,052. The policy, in your opinion, should be to prevent the rupee going below 1*s.* 4*d.*, but of course we cannot control the future, which might take it above 1*s.* 4*d.*?—Quite so, and, if it went in that way above 1*s.* 4*d.*, it would really be a benefit to India—a distinct benefit to India, which ought never to be lost sight of.

13,053. (*Sir F. Mowatt.*) The alternative to opening the mints at that point, when the rupee reached or passed 1*s.* 4*d.*, would be to alter the rate at which you would issue rupees?—Yes; you might say 1*s.* 6*d.*, and so go on going up.

13,054. (*Sir D. Barbour.*) You referred to the rise which takes place in the value of the currency or the standard coin when the quantity is limited. It takes place, you have explained, by the growth of the country in which the coin is current?—And the wear and tear of the coin too.

13,055. By the gradual diminution of the quantity of coinage, and the general growth of the country?—Yes.

13,056. You also referred to the fall which may take place in the value of the coinage if the exports fall off very much. I suppose you would admit that a rise might take place in the value of the coin if the exports largely increased owing to good harvests, or anything of that sort. For instance, I believe it to be the case that the value of the paper currency in Argentina has risen when the exports were large?—Yes, that is possible, but that possible rise in India is checked in appearance, at all events, by the fact of the obligation to give rupees in exchange for gold.

13,057. It practically cannot rise above 1*s.* 4*d.*?—Practically it cannot rise above 1*s.* 4*d.*, although the amount of gold—really what lies at the bottom of it all is that the amount of gold represented by that particular fraction in relation to commodities, changes its value. But as between silver and gold, as long as that obligation exists to give rupees in exchange for gold at that rate, the rupee cannot, in relation to gold, rise.

13,058. When the American currency was so much depreciated at the time of the Civil War, the productive power of the country had very much fallen off owing to that war?—Yes, that is so.

13,059. And that may have been one of the causes that added to the depreciation of the currency at that time?—I do not think so.

13,060. It is a possible cause?—Yes. I do not think it did, but it is a possible cause.

13,061. Theoretically it is possible?—Yes.

13,062. And of course the removal of that cause, when the Civil War was over, would be an influence that would tend to raise the value of the currency again?—There was immense elasticity. As I have said, the natural elasticity of production in the United States is very much greater than could be the case in India, and there was a great revival of elasticity immediately after the war; but the equilisation of the paper currency after a time became gradual—continuous, but gradual; it did not go up in leaps and bounds.

13,063. Would you make gold a legal tender in India at once?—I think that is only a question of words. In my view gold is a legal tender.

13,064. Practically it is a legal tender at this moment?—Yes, I have no objection to say so.

13,065. The Government, as you are doubtless aware, will receive it in payment of Government dues?—Yes.

13,066. And the Government will give silver rupees for sovereigns?—Yes.

13,067. Or for gold?—Yes.

13,068. So that, if you owed a man 15 rupees and you offered him a sovereign, he would feel satisfied that he could go to the nearest treasury and get rupees?—Yes.

13,069. It would be the same thing as giving him a cheque which would certainly be cashed?—Yes.

13,070. Therefore for practical purposes gold is a legal tender at this moment in India?—Just so.

13,071. And the only further influence that making it a legal tender could have, would be a possible sentimental influence?—Yes, the public mind gets affected by descriptions—words.

13,072. The Government of India at present receive gold and give out rupees, and I believe the amount of gold that has been received in that way is over 1½ millions. Do you think it would be the best plan to go on receiving gold in that way and accumulating it, or would you say at once, "We will give gold as long as we have it in the treasury to anybody who brings silver rupees?" It is a question of policy whether it would be better to go on accumulating gold, or whether it would be better at once to say, "We will "let the gold go out just as we allow it to come in"?—No, I should not as yet allow it to go out. I should go on accumulating.

13,073. You would for the present go on accumulating?—Yes. I should get the greatest possible stability in the value of the rupee before I look to giving it out.

13,074. Have you formed any opinion as to what amount of gold you would require to be paid in before you began to give it out?—I do not think I have any view on that point which is worth anything. I do not think it is very much that is wanted. The experience of the Dutch East Indies struck me as very remarkable in that way—how very little gold there is in Java.

13,075. But in Java silver coins are current, which may be sent to Holland, where they are legal tender?—Yes.

13,076. And convertible into gold?—Well there is scarcely a legal obligation, I think, in Holland to do that.

13,077. But practically?—Practically it is exchangeable just as, practically, silver is exchangeable for gold here, but you look upon Java and Holland as one. It is the same currency, and even taking them together the quantity of gold is not very considerable. In Java itself the quantity of gold is very inconsiderable; I think it is under 400,000*l.* if I remember right.

13,078. Do you happen to remember exactly why the rate of 1*s.* 4*d.* was adopted by the Herschell Committee? I will tell you why I ask the question; you seem to think it was adopted because it was the minimum rate which would give the Government of India what it wanted. My recollection is rather this, that the Herschell Committee thought that, when the coinage of silver was stopped, the rupee might rise suddenly to a great height and cause inconvenience to merchants and others, and therefore they proposed 1*s.* 4*d.* as a provisional limit to any possible rise of the rupee?—That was partly in our mind, no doubt; that was a branch of the general statement—that we wanted as little dislocation as possible: and that also was part of the consideration, as well as providing what was wanted by the Finance Minister.

13,079. You will probably recollect that the original proposal of the Government of India was to close the mints to silver, not to fix any rate at that time, but to take power to declare at some subsequent period a rate not exceeding 1*s.* 6*d.*?—Yes.

13,080. And that was altered in that respect by the Herschell Committee?—Yes. We also thought it not desirable to give the Indian Government too great freedom of action in such a matter. We thought it was essential that the popular mind should be struck with permanence, and that therefore we had better adopt a basis which would probably endure.

13,081. You say you would as soon think of giving gold for silver in India as you would think of giving sovereigns in exchange for silver here, if you were Chancellor of the Exchequer. But it would be a

Rt. Hon. L. H. Courtney, M.P.

17 March 1899.

very much more serious liability in India, would it not?—It would, no doubt.

13,082. In this country the quantity of silver is limited and known, and it is not more than sufficient for the requirements of the country?—Just so.

13,083. Then you say that fixity of exchange has been secured by screwing up the rupee. Of course you recognise that the old rate was 2*s.* and that, in adopting 1*s.* 4*d.*, the increased value of gold has been recognised to a large extent?—Yes.

13,084. (*Mr. Le Marchant.*) You were referring to France. Did you say that you regarded the value of the 5-franc piece as being maintained only by limitation?—Yes, practically that is so.

13,085. As a matter of fact, the Bank of France has a very large reserve of gold?—And a very large quantity of silver too.

13,086. Do you think that, if the gold in the Bank of France were replaced by an equal nominal value of silver, so that the total volume of currency remained the same, and, therefore, the limitation the same, the value of the 5-franc piece would be equally maintained?—Some alteration might be made, but of course the limitation to which I referred was the limitation of the quantity of silver. There is no legal limitation of the quantity of gold. There is at any moment a certain amount of gold in hand, but the gold may be freely bought and freely coined; therefore there is no legal limitation of the quantity of gold.

13,087. But the total amount of currency will affect the value of any part of the currency, will it not, taking gold and silver together?—That is so, yes.

13,088. Would you consider that the maintenance of the exchange value of the rupee in India would be affected by the amount of gold that might come into circulation?—Automatically, you mean?

13,089. Yes?—Oh, no.

13,090. You do not think that would bear upon it?—No, because I think the gold that would come in now automatically would only come in as the quantity of trade transactions required such an addition. Therefore the mass of the currency would be regulated by the necessities of trade, which now in my judgment work automatically.

13,091. Is not an outflow of currency necessary for any automatic system—for instance, at the time of the year when it might be in less immediate demand?—To be perfectly automatic, of course, there ought to be a free outflow as well as a free inflow.

13,092. Would not the outflow be largely assisted by the presence of an appreciable proportion of gold in India that could flow out?—I do not think, myself, that there is any great outflow from India, certainly not towards this country; there may be further East an outflow. And you may say that such outflow as there is would be facilitated by an increase in the quantity of gold in India.

13,093. So far as such gold afforded a practical convertibility, it would be an assistance in maintaining exchange rates?—Yes. I think by-and-bye, if we waited, we should find such a quantity of gold in India that the bankers themselves would be able to give gold, or at all events give exchange drafts, without any difficulty from any outflow.

13,094. But you would leave that to time?—I would.

13,095. (*Mr. Holland.*) Do you attach any importance to the contention of some witnesses we have had before us that India is greatly disadvantaged in her competition with silver-using countries by the present system?—No. I am not very much impressed with that. No doubt there are times of transition during which a country where the *entrepreneurs* of industry can pay their wages in depreciated currency enjoy an advantage in their commerce; and it may be said that India has suffered that particular disadvantage; but I regard that as rather a transitory advantage, so far as it is an advantage at all.

13,096. You contemplate, as at any rate a possibility, that, if the United States were to open their mints, it might be worth while to reconsider the question of reopening the Indian mints?—I suspect that not only would it be worth while, but it would have to be done.

13,097. Would you go so far as to suggest that the United States might be encouraged to take a step of that kind? We have had witnesses before us who have suggested that the United States should be encouraged to take that step?—I rather foreshadowed the form of encouragement which I should offer. I would take my stand on my position as a Finance Minister who has known the inconvenience of rupees falling to low level, and I would not willingly run the risk of renewing that experience; but, certainly, realising, as I do, that if the United States took action it would have an effect on the Indian currency, and that quite conceivably it might bring the value of the silver in the rupee above 1*s.* 4*d.*, I would readily declare that in that event I should be prepared to support the United States Government by action in India.

13,098. You would not put it the other way about, and reopen the Indian mints on the chance of the United States following?—I do not think an Indian Minister could afford to do that.

13,099. I understand that you differ from some of the witnesses we have had before us who favour the undertaking of the responsibility of convertibility by the Government. You are against the Government undertaking that responsibility?—Yes, I am.

13,100. If the rate of exchange were to fall owing to unfavourable conditions, would you adopt any artificial means to bolster up the rate, or would you rely solely on trade influences?—One cannot prophesy as to the future, especially in India; you may be forced by popular excitement to do things which your own judgment does not approve, but I should be disposed to rely on the self-adjusting action of trade.

13,101. (*Mr. Campbell.*) With regard to convertibility, although you say you would not undertake the responsibility of such a step, would you go so far as to say that, even if you had a sufficient quantity of sovereigns in the Treasury, you would refuse to exchange them at the rate of 15 rupees to the sovereign?—Oh, no; if I had a sufficient quantity of sovereigns I might easily do it. It is a thing that I should regard as a matter of convenience to myself.

13,102. It would be optional on your part?—I would not bind myself to do it.

13,103. Then the position would be very much the same as it is in France?—Yes.

13,104. Then suppose the exchange, owing to an adverse trade balance, were to fall below 1*s.* 4*d.*, and the Treasury held a considerable amount of sovereigns, would you propose that these should be utilised to liquidate the home charges, in preference to the Secretary of State selling his Council bills below the 1*s.* 4*d.*?—Well, I should be indisposed to give any opinion as to what I would do under the circumstances, until they arose. I should like to know how long a period had passed before the crisis, and the amount I had in hand, and what the immediate prospects were of a recovery, and so on. I should look upon my position as a banker, and consider whether the movement was one likely to lead to a greater dislocation, or one that you might safely take as relieving a short emergent crisis.

13,105. (*Sir F. Mowatt.*) But you would regard the operation as legitimate if it suited the Government at the time?—Yes.

13,106. (*Mr. Campbell.*) In paragraph 135 of the Herschell Committee's Report, it is stated that, "It "is impossible, in view of these considerations, not to "come to the conclusion that to close the mints for "the purpose of raising the value of the rupee is open "to much more serious objection than to do so for "the purpose of preventing a further fall." Now, when that Report was written, the value of the rupee was 1*s.* 2$\frac{1}{4}$*d.* Can you explain why, looking to that declaration, a rate of 1*s.* 4*d.* was adopted, which was 8 or 9 per cent. above the rate ruling at the time?—

We did not adopt any limit as a thing to be at once established. We adopted a limit beyond which we thought it imprudent that the rupee should be artificially sprung up.

13,107. And 1*s.* 4*d.* was that limit?—Exactly.

13,108. I suppose it was recognised that in all probability the closing of the mints, especially if followed by the repeal of the Sherman Act, would lead to a great fall in the price of silver?—Yes.

13,109. And that would accentuate the difference between the intrinsic silver value of the rupee, and its artificial value?—Yes.

13,110. Now, we know what has occurred—that there is a fall in the value of silver to the equivalent of 10*d.* or 11*d.* per rupee. Looking to that, do you still think that 1*s.* 4*d.* was a suitable rate to have adopted?—Oh yes. I do not think the subsequent fall in the value of silver at all affects the question.

13,111. Then do you admit that there might be disadvantages in pushing the artificial value of the rupee too high above its intrinsic value?—Oh yes, there certainly are. The question is whether it is too high.

13,112. The difference between 11*d.* and 1*s.* 4*d.*, you think, is not too high?—But the artificial value of the rupee has not been pushed from 11*d.* to 1*s.* 4*d.* The value of the rupee when the pushing began, was above 11*d.* We have not changed the situation in India in degree from 11*d.* to 1*s.* 4*d.*, but from 1*s.* 2½d., or something like that, to 1*s.* 4d.

13,113. With the Indian mints closed to silver, and no fresh currency obtainable, except from gold at the Government ratio, would you admit that the monopoly rupee must, in course of time, rise to any ratio the Government choose to fix?—The Government might go on, undoubtedly. It might alter the 1*s.* 4*d.* to 1*s.* 6*d.* or 1*s.* 8*d.*, or even 2*s.*, if they resolutely refused to give out rupees in exchange for gold, and the rupees shrank in quantity; it might take some time, but they might do it.

13,114. Would you consider that the fact of exchange having risen in response to this in the course of four or five years, is itself a proof that the 1*s.* 6*d.* or 1*s.* 8*d.*, or whatever it might be, is a proper limit?—No. I do not see how it bears on the question whether it would be a proper limit. I do not think I understand that question.

13,115. Exchange has risen to 1*s.* 4*d.* in the course of five years, and I understand you to say that that proves to your mind that 1*s.* 4*d.* was justified?—Well, I think it may be said to be so.

13,116. Then I put it to you, suppose the Government had adopted 1*s.* 8*d.*, and in the course of two years hence the rate had risen to 1*s.* 8*d.*, would that have been equally a proof that 1*s.* 8*d.* was justified?—No, I do not think it would. You have to take into consideration the change which you are introducing between the classes in India, and the change which you are introducing in respect of the public debt in India, and generally in respect of the economic situation in India; and you would not be justified in trying, by reducing the quantity of rupees and giving an artificial value to rupees, to screw it up to 1*s.* 8*d.* or 2*s.*

13,117. Do you believe the raising of the rupee above its intrinsic value is a tax upon production?—The raising of the rupee above its intrinsic value is a tax not merely upon production; in its process it may have been a tax on production; it is an additional tax on the agriculturists and the rent payers.

13,118. The producing classes?—So far as they are the producing classes, yes. It increases the burden of rent, undoubtedly.

13,119. (*Sir D. Barbour.*) You talk about the rupee being pushed up from 1*s.* 2½*d.* to 1*s.* 4*d.* You are, no doubt, aware that, a short time before the mints were closed, it had been 1*s.* 4*d.*?—Yes.

13,120. And even higher?—Yes.

13,121. So that it was only retracing a portion of the fall that had taken place in the preceding years?—Yes. I am afraid I should have to add, in order to make that complete, that, judging by the outside circumstances, I do not think it would have risen again from 1*s.* 2½*d.* to 1*s.* 4*d.*, if it had not been for what we did.

13,122. (*Chairman.*) It has been suggested to the Committee by Lord Northbrook that, should there be a surplus in India on the current financial year, that surplus should be used as a nucleus for a gold reserve. What are your views on this matter?—I cannot say that I have considered this proposal, but it is apparent at once that it proceeds from a point of view which I have rejected. I look to the currency being automatically regulated and reserves accumulated in the ordinary course of banking business. I should therefore discourage the intervention of Government by such an appropriation of the anticipated surplus, which I should prefer to see dealt with on ordinary lines of policy.

The witness withdrew.

Adjourned.

INDIAN CURRENCY COMMITTEE, 1898.

INDEX AND APPENDICES

TO THE

EVIDENCE

TAKEN BEFORE THE

COMMITTEE

APPOINTED TO INQUIRE INTO THE

INDIAN CURRENCY.

Presented to both Houses of Parliament by Command of Her Majesty.

LIBRARY OF THE BOMBAY BRANCH OF THE ROYAL ASIATIC SOCIETY

LONDON:
PRINTED FOR HER MAJESTY'S STATIONERY OFFICE,
BY EYRE AND SPOTTISWOODE,
PRINTERS TO THE QUEEN'S MOST EXCELLENT MAJESTY.

And to be purchased, either directly or through any Bookseller, from
EYRE AND SPOTTISWOODE, East Harding Street, Fleet Street, E.C., and
32, Abingdon Street, Westminster, S.W.; or
JOHN MENZIES & Co., 12, Hanover Street, Edinburgh, and
90, West Nile Street, Glasgow; or
HODGES, FIGGIS, & Co., Limited, 104, Grafton Street, Dublin.

1899.

[C.—9376.] *Price 3s. 9d.*

SALE OF GOVERNMENT PUBLICATIONS.

The under-mentioned Firms have been appointed sole Agents for the sale of Government Publications, including Parliamentary Reports and Papers, Acts of Parliament, Record Office Publications, &c., &c., and all such works can be purchased from them either directly or through retail booksellers, who are entitled to a discount of 25 per cent. from the selling prices:—

IN ENGLAND:—

For all publications *excepting* Ordnance and Geological Maps, the Hydrographical Works of the Admiralty, and Patent Office Publications:—Messrs. Eyre and Spottiswoode, East Harding Street, E.C.

For Geological Maps:—Mr. E. Stanford, Cockspur Street, S.W.

For Hydrographical Works of the Admiralty:—Mr. J. D. Potter, 31, Poultry, E.C.

Patent Office Publications are sold at the Patent Office.

For all Publications *excepting* the Hydrographical Works of the Admiralty and Patent Office Publications.

IN SCOTLAND:—Messrs. John Menzies & Co., 12, Hanover Street, Edinburgh, and 90, West Nile Street, Glasgow.

IN IRELAND:—Messrs. Hodges, Figgis, & Co., Limited, 104, Grafton Street, Dublin.

ORDNANCE SURVEY MAPS OF GREAT BRITAIN AND IRELAND:—There are Agents for the sale of these Maps in most of the chief towns. Copies can also be ordered at many Head Post Offices, and through any Bookseller, or from the Director-General Ordnance Survey, Southampton; or, in the case of Ireland, from the Officer in Charge Ordnance Survey, Dublin.

The following is a list of some of the more important Parliamentary and Official Publications recently issued:—

Parliamentary:

Statutes—

Public General, Session 1898. With Index, Tables, &c., &c. Roy. 8vo. Cloth. Price 3s.

Second Revised Edition. By authority. A.D. 1235–1713 to A.D. 1872–1880. XI. Vols. Price 7s. 6d. each.

Revised Editions. Tables showing subsequent Repeals, effected by Acts of 60 & 61 Vict. 1897. Price 6d.

Statutes in Force. Chronological Table of and Index to. Fourteenth Edition. To end of 61 & 62 Vict. 2 vols. Price 10s. 6d.

The Statutory Rules and Orders revised. Statutory Rules and Orders, other than those of a Local, Personal, or Temporary Character, issued prior to 1890, and now in force. Vols. I. to VIII. Price 10s. each.

Statutory Rules and Orders other than those of a Local, Personal, or Temporary Character. With a List of the more important Statutory Orders of a Local Character arranged in classes; and an Index. Roy. 8vo. Boards. Issued in the years 1890, 1891, 1892, 1893, 1894, 1895, 1896, 1897, and 1898. Price 10s. each.

Statutory Rules and Orders in force on 1st January 1893. Index to. Imp. 8vo. Cloth. Price 10s.

Statutory Rules and Orders, 1899. Registered under the Rules Publication Act, 1893. In course of issue.

Acts of Parliament, Public and Local and Private. Session 1899. In course of issue.

[C. 9223.] Africa. Trade, Shipping, Railways, and Economic Condition generally. With Maps. Price 1s. 6d.

[C. 9281.] Factories and Workshops. Report of Chief Inspector. 1898. Part I. Tables.

[C. 9287.] East India. Countervailing Duties on Sugar. Correspondence respecting, and Copy of the Act. Price 1½d.

[C. 9329.] China (No. 2). Correspondence with Russia respecting Railway Interests. February 1898; April 1899. Price 0½d.

[C. 9332.] Egypt (No. 5). Report on the Soudan. Price 3d.

[C. 9345.] South Africa Republic. Complaints of British Subjects. Price 2s.

[C. 9346.] Wages of Domestic Servants. Report on. Price 3½d.

H.C. No. 124/99. Local Assurance Companies. Statement of Account. 1898. Price 2s. 8d.

H.C. No. 190/99. Telephone System (Interference). Treasury Minute, dated 8th May, 1899. Price 1d.

Mines. Reports of Her Majesty's Inspectors for the Year 1898, with Summaries of the Statistical portion under the provisions of the Coal Mines Regulation Act, 1887; Metalliferous Mines Regulation Acts, 1872–1875; Slate Mines (Gunpowder) Act, 1883, Districts Nos. 1 to 13. Set complete. Price 7s. 1d.

Mines in the United Kingdom and the Isle of Man. List of, for 1897. Price 2s.

Quarries do. do. Do. 1897. Price 8s. 2d.

Mines Abandoned. List of the Plans of. Corrected to 31st December 1897. Price 9½d.

The following appear periodically, and can be subscribed for:—

Trade of the United Kingdom with British Possessions and Foreign Countries, showing the Quantities and the Declared Value of the Articles.

Trade Reports of the British Colonies, with information relative to population and general condition.

Trade Reports by Her Majesty's Representatives in Foreign Countries, and Reports on Commercial and General Interests.

The Proceedings of Parliament in public and private business, published daily. House of Lords. Price 1d. per 4 pp.; House of Commons, 1d. per 8 pp.

State Trials, being Reports of the Chief State Trials which have taken place between 1820 and the present time, published under the supervision of a Committee appointed by the Lord Chancellor. Roy. 8vo. Half-cloth. 1820–1823 to 1850–1858. 2 vols. Price 10s. each.

Challenger, H.M.S. A Report on the Scientific Results of the voyage of, during the years 1873–1876, under the command of Captain George S. Nares, R.N., F.R.S., and Captain Frank Turle Thomson, R.N. Prepared under the superintendence of the late Sir C. Wyville Thomson, Knt., F.R.S.; and now of Sir John Murray, K.C.B. Complete in Fifty Volumes. Price 10*l.* 15*s.*

INDEX TO THE MINUTES OF EVIDENCE.

Absorption of currency, (*Arthur*) 2284-8; (*Lindsay*) 3629–32, 3899, 3989–94.

Accounts of Government of India, form of, (*O'Conor*) 12,095–6, 12,124–33.

Agricultural capacity of India, (*O'Conor*) 1375–80, 1538–47; (*Arthur*) 1689, 2007, 2055–64.

Agricultural interests in India, how affected by exchange, (*O'Conor*) 1388–95, 1586–9; (*Finlay*) 2966–72; (*Ralli*) 5916, 5938–51, 6257–89; (*Steel*) 7110–4; (*Adam*) 7806, 7832.

American currency system, (*Lindsay*) 3934-8, 4140–2; (*Montagu*) 6668, 6670; (*Rothschild*) 7614, 7724–6; (*Giffen*) 10,120–3, 10,174; (*Marshall*) 11,775; (*Aldenham*) 12,753–4; (*Courtney*) 12,996, 13,003, 13,014–5, 13,058–62.

American envoys, currency proposals of, (*Arthur*) 1629–31; (*Rothschild*) 7613; (*Cruickshank*) 9499–508; (*Lubbock*) 11,217; (*Aldenham*) 12,839–40, 12,858–64, 12,913.

Argentine Republic, competition with India, (*Duncan*) 11,940; (*O'Conor*) 12,155.

,, ,, currency system, (*Galloway*) 9926–32, 9983; (*Bois*) 11,239–70; (*Barclay*) 11,549, 11,752–6.

Assessed taxes, possibility of increase, (*O'Conor*) 1447–54, 1529–37; (*MacDonnell*) 5866; (*Northbrook*) 8415; (*Mackenzie*) 10,432–3.

Austrian currency, (*Montagu*) 6666; (*Rothschild*) 7623; (*Giffen*) 10,039–40; (*Courtney*), 13,009.

Automatic currency. *See* "Currency."

Bagehot, Walter, views on the silver question, (*Giffen*) 10,032–6, 10,138, 10,142.

Balance of Trade:

- Dependence of gold standard on, (*Rothschild*) 7614, 7704.
- Effect on, of contraction of currency. *See* "Currency, contraction of."
- Relation to council bills, (*O'Conor*) 1263, 1269, 1271, 1292–3, 1297, 1301, 1329–33.
- Relation to rate of exchange, (*O'Conor*) 1241–301; (*Arthur*) 2008–37, 2242–51; (*Finlay*) 2664–80, 2707–8, 3045–53, 3128–9; (*Lindsay*) 3824–7; (*Vincent*) 5688–9; (*Ralli*) 6339–52, 6417–8; (*Steel*) 7323–7; (*Adam*) 7830–1, 7936–46; (*Cruickshank*) 9386, 9634–6; (*Marshall*), 11,815–8.
- Statistics, (*Mackay*) 250–3, 593–7; (*O'Conor*) 971–2, 981–2, 1314–8; (*Finlay*) 2826–9; (*O'Conor*), 12,043, 12,097–100; (*Aldenham*) 12,821.

Bank of England notes, (*Lindsay*) 4164–70; (*Vincent*, 547–9, 5568–75, 5636–40, 5702–3, 5715.

,, ,, participation of, in establishment of Gold Standard for India, (*Lindsay*) 3756, 4001; (*Farrer*) 12,237, 12,250–2; (*Darwin*) 12,592, 12,651–7; (*Aldenham*) 12,815.

Bank of India, suggested establishment of, (*O'Conor*) 1200, 1204; (*Lindsay*) 3658–63, 3678–9; (*Montagu*) 6646, 6741–4; (*Rothschild*) 7683, 7723, 7738–9; (*Northbrook*) 8450; (*Giffen*) 10,346–9; (*A. de Rothschild*) 11,853; (*Macdonald*) 12,443.

Bank rate in India, (*Mackay*) 478–80, 521–4; (*O'Conor*) 1354; (*Arthur*) 1677–83, 1735, 1821–4, 1903–5, 1967–75, 1985–9; (*Lindsay*) 3283–7, 3290, 3294–303, 3431, 3462, 3623–6; (*Ralli*) 5925–9, 6142–3; (*Montagu*) 6711–5; (*Steel*) 7186–91; (*Adam*) 7760–4; (*Coke*) 8077–81; (*Cameron*) 8372–4; (*Cheetham*) 8711, 8727–32, 8776, 8888–97, 9009–11; (*Cruickshank*) 9380–2. *See also* "Stringency."

Bank reserves in United Kingdom (*Giffen*) 10,093–6.

Banking system of India, (*Mackay*) 276–7; (*Lindsay*) 3473–82; 3611–7; (*MacDonnell*) 5753, 5759; (*Raphael*) 6565–7, 6569.

Bengal Chamber of Commerce, opinion of, as to closing of mints, (*Mackay*) 45–6.

,, ,, ,, representation from, in 1892, (*Mackay*) 23.

Bimetallism advocated by Bengal Chamber of Commerce in 1892 (*Mackay*) 23.

,, *See also* "American envoys" *and* "International agreement for coinage of silver."

Bland Act, (*Mackay*) 15.

Bois (Mr. H.), Scheme for establishing a Gold Standard in India, 11,287, 11,306-24.

Bombay, public opinion in, as to closing of mints, (*Mackay*) 50–1.

,, ,, ,, as to reopening of mints, (*Rustomjee*) 9814–5.

Borrowing by Secretary of State for India and by Government of India:

- (1.) By Secretary of State in London, (*Mackay*) 613–6, 658–60; (*O'Conor*) 1012–4, 1016–20, 1482–5; (*Finlay*) 2617–22, 2805, 2836, 2885–7; (*Waterfield*) 4336–9, 4369, 4388–94; (*Rustomjee*) 9755.
- (2.) By Government of India in India, (*O'Conor*) 1008–11, 1015, 1043–50, 1216–20; (*Arthur*) 2370–92; (*Finlay*) 2610–6, 2836, 2858–72; (*Rustomjee*) 9786–91.

Borrowing in India by owners of cotton-mills and jute-mills, (*Cheetham*) 8727, 8792–4, 8888–96; (*Cruickshank*) 9429, 9605–7, 9769–74.

Borrowing in London by Indian Railway Companies (*O'Conor*) 1013–4, 1024; (*Finlay*) 2630–5, 2692–5, 2806–8.

"Bounty" on exports arising from low exchange. *See* "Exchange value of the rupee: Effect of a rise or fall: Effect on export trade."

British dollars, (*O'Conor*) 1137–9.

Burma, absorption of rupees in. *See* "Absorption of Currency."

Busy season in Egypt, currency requirements of, (*Vincent*) 5404, 5415, 5423, 5469.

,, ,, in India, currency requirements of, (*Arthur*) 2281–8; (*Lindsay*) 3310, 3435–44.

Canada, banking system of, (*Clouston*) 6755–7, 6768–71, 6779–94, 6798–813.

,, monetary system of, (*Lindsay*) 3603; (*Clouston*) 6758–67, 6772–6, 6778; (*Lubbock*) 11,034–8, 11,110; (*Aldenham*) 12,758–9, 12,773–6.

Capital:

- (1.) Effect of high rate of discount in attracting, (*Arthur*) 1859–63, 2119, 2312–6; (*Lindsay*) 3850–1, 4152–6; (*Montagu*) 6715–7; (*Rothschild*) 7614, 7645–8, 7651, 7712; (*Adam*) 7765, 7847–8.
- (2.) Effect of stable exchange in attracting, (*Christie*) 4780–6, 4905; (*Cox*) 5098–101; (*Vincent*) 5585, 5713; (*Ralli*) 6048–52, 6099–101; (*Raphael*) 6460–2, 6494–5; 6500; (*Montagu*) 6715–7; (*Probyn*) 6827; (*Rothschild*) 7612–4, 7718–9; (*Northbrook*) 8399; (*Cheetham*) 9012; (*Cruickshank*) 9651; (*Galloway*) 9967–8; (*Mackenzie*) 10,487–9; (*Bois*) 11,272–3; (*Marshall*) 11,773. *See also* "Exchange value of the rupee, effect of instability" *and* "Stability of exchange."
- (3.) For permanent investment in India, supply of, (*Arthur*) 2354–64; (*Rothschild*) 7614; (*Cheetham*) 8772–6, 8886–7, 8981–90; (*Mackenzie*) 10,546–9.
- (4.) Loanable, scarcity of, since closing of mints. *See* "Stringency."
- (5.) ,, supply of, in India, (*Arthur*) 2383–91.
- (6.) Need of, in India, (*Arthur*) 1691–6, 1910; (*Lindsay*) 3854, 4251; (*Cox*) 5041; (*Raphael*) 6461; (*Mackenzie*) 10,459, 10,490–1; (*Marshall*) 11,814.
- (7.) Remittance of, from India, (*Mackay*) 287, 487, 525–8, 587, 617–8, 719, 737–43, 775–6; (*O'Conor*) 992, 1042; (*Arthur*) 1670–2, 1811–5, 1911–21, 1958–62; 1984, 2044–8, 2177–207; (*Lindsay*) 3713–7; (*Cox*) 4995–5002, 5108–9; (*Ralli*) 5916, 5968–70, 6290; (*Steel*) 7077–80, 7243–9; (*Adam*) 7756–8, 7849–58, 7956–7; (*Coke*) 8168–70; (*Cameron*) 8290–4; (*Cheetham*) 9003; (*Cruickshank*) 9384; (*Mackenzie*) 10,460.
- (8.) Supply of, to Ceylon under silver standard, (*Christie*) 4780, 4784, 4905.
- (9.) ,, ,, to India, affected by closing of mints, (*Northbrook*) 8417.
- (10.) ,, ,, ,, if mints were re-opened, (*Steel*) 7330–5.
- (11.) ,, ,, ,, under gold standard, (*Arthur*) 1748; (*Raphael*) 6462, 6500.
- (12.) Withdrawal of, from Ceylon since closing of mints, (*Christie*) 4559–61, 4785–6.

See also "Investment."

Ceylon:

- Bank rate. *See* "Stringency."
- Currency, (*Christie*) 4435–41, 4574, 4700; (*Bois*) 11,291.
- Labour, (*O'Conor*) 1372, (*Christie*) 4595–604, 4626–8, 4740–2.
- Population, (*O'Conor*) 1189.
- Prices, (*Christie*) 4594, 4605, 4611–4, 4715–23, 4797.

CEYLON—*cont.*
Supply of capital. *See* "Capital."
Taxation, (*Christie*) 4701–6, 4768–70, 4898; (*Bois*) 11,301.
Tea industry. *See* "Tea."
Wages, (*O'Conor*) 1374; (*Christie*) 4445, 4503–7, 4592, 4708–29, 4753–5.

Chambers of Commerce in India, views on currency question, (*Mackay*) 492–5, 692–4; (*Arthur*) 1624, 2128–9, 2168; (*Finlay*) 2950–1; (*Lindsay*) 4073; (*Cox*) 5044–5, 5051–4; (*Ralli*) 6173.

Charge for exchange, (*Waterfield*) 4936–414; (*O'Conor*) 12,090, 12,093–4. *See also* "EXCHANGE VALUE OF THE RUPEE: Effect of a rise or fall: Effect on financial position of Government of India."

CHINA:
Competition with Bombay cotton mills, (*Mackay*) 327–41; (*O'Conor*) 1118–24, 1148–9; (*Cheetham*) 8738–44, 8916–26; (*Cruickshank*) 9597; (*Macdonald*) 12,334–60, 12,465–73, 12,485–7, 12,493–514.
,, with Indian and Ceylon tea planters. *See* "Tea."
Currency of, (*Cameron*) 8197–9, 8201, 8248–51, 8281–4, 8288–9, 8345–61; (*Cheetham*) 8750; (*Macdonald*) 12,381–92.
Development of, (*Ralli*) 5994; (*Adam*) 7868; (*Cameron*) 8200, 8276, 8288, 8341, 8381–2; (*Cruickshank*) 9597; (*Rustomjee*) 9736; (*Duncan*) 11,901–3.
Effect on competition with India of divergence between rupee and silver, (*Coke*) 8141; (*Cameron*) 8195–6, 8252–60, 8386–8; (*Cheetham*) 8738–44; (*Duncan*) 11,896–906; (*Farrer*) 12,194.
,, on cost of production of fall in price of silver, (*Mackay*) 328–31.
Export duties, (*Christie*) 4762–4; (*Cameron*) 8253–4, 8257–9; (*Northbrook*) 8498–500.
,, of cotton to, from India, (*Mackay*) 258; (*O'Conor*) 867–71.
Likin duties, (*Christie*) 4761–2; (*Cameron*) 8261; (*Macdonald*) 12,370, 12,474–5, 12,507–14.
Prices in, (*Christie*) 4620–5; (*Acworth*) 7521; (*Cameron*) 8277–80; (*Cheetham*) 8751–5; (*Macdonald*) 12,394–402.
Rate of Exchange on India. *See* "Exchange between India and China, variations in the rate."
Supply of capital to, (*Arthur*) 1685, 1922–5; (*Coke*) 8164.
Trade with India, (*O'Conor*) 821, 860–3, 865; (*Coke*) 8162–4; (*Graham*) 9094–103; (*O'Conor*) 12,060–76.
Wages, (*Mackay*) 342; (*O'Conor*) 1161–2; (*Adam*) 7869; (*Macdonald*) 12,337, 12,488–9.

CLOSING OF INDIAN MINTS:
(1.) As to necessity of, (*Raphael*) 6425–6; 6,542–52; (*Montagu*) 6617–8; (*Steel*) 7061–3; (*Rothschild*) 7610; (*Adam*) 7752, 7810; (*Coke*) 8090–8; (*Northbrook*) 8396; (*Cheetham*) 8682–3; (*Graham*) 9026, 9036–7; (*Galloway*) 9880–2; (*Giffen*) 10,049–50, 10,082; (*Mackenzie*) 10,407–9; (*Lubbock*) 11,030–1, 11,133, 11,153; (*Macleod*) 12,928, 12,932; (*Courtney*) 12,986.
(2.) Criticism of details of measure, (*Probyn*) 6829–36; (*Rothschild*) 7610, 7694.
(3.) Effects of:
Discontent among natives of India, alleged increase of, (*Mackay*) 156, 177–80, 263–4; (*O'Conor*) 1397; (*Probyn*) 6990; (*Galloway*) 9909; (*Barclay*) 11,598, 11,605–10, 11,660–3, 11,666; (*O'Conor*) 12,015–7, 12,041.
Effect on competition with silver-using countries. *See* "Exchange value of the rupee: divergence from intrinsic value."
,, exchange value of the rupee, (*Mackay*) 76, 89, 93–5, 100, 111; (*Cox*) 4976–9; (*Steel*) 7158–64; (*Aldenham*) 12,737, 12,849–52; (*Courtney*) 12,994–7.
,, general prices. *See* "Prices."

System of assessment, (*MacDonnell*) 5736–43, 5800–23, 5904–14; (*Northbrook*) 8581–4; (*Mackenzie*) 10,598–602; (*Dutt*) 10,886–903.

Legal tender of rupees. *See* "Rupee Currency."

Lindsay (Mr. A. M.): Scheme for fixing Exchange between Rupees and Gold:—

Based on Ricardo's proposals in 1819, (*Lindsay*) 3350–9, 3680–2, 3736–44; (*Macleod*) 12,937.

Gold standard offices to be established in India and England, for issue of sterling drafts payable in England in exchange for rupees, and of rupee drafts in exchange for sterling, (*Lindsay*) 3380–8, 3731–5, 4035–41; (*Vincent*) 5503–6; (*Adam*) 7782, 7836–9; (*Coke*) 8034; (*Northbrook*) 8425; (*Graham*) 9334 (*note*); (*Cruickshank*) 9387, 9647–9; (*Giffen*) 10,127; (*Lubbock*) 11,099; (*Farrer*) 12,224–6; (*Darwin*) 12,568; (*Aldenham*) 12,815.

,, ,, reserve, amount of, (*Lindsay*) 3382, 3399–404, 3435–44, 3446–57, 3528–72, 3934, 4010–31, 4131, 4148–51; (*Vincent*) 5491, 5543–9; (*Steel*) 7165–6, 7174–9.

,, ,, ,, location in London, (*Lindsay*) 3833, 4001, 4032, 4056–7, 4236–7; (*Montagu*) 6671–3; (*Probyn*) 6991–2; (*Rothschild*) 7626–7; (*Farrer*) 12,224–5; (*Aldenham*) 12,815.

Gold standard reserve, replenishment of, by melting down rupees, (*Lindsay*) 3395–8, 3466–7, 3683–9, 3769, 3788–804, 4042–5; (*Vincent*) 5499–502; (*Raphael*) 6456–8, 6533–6; (*Montagu*) 6674; (*Adam*) 7782.

,, ,, ,, ,, by further borrowing, (*Lindsay*) 3458, 3469, 3770.

Prices, effect on, (*Lindsay*) 3961, 3973, 3985–7, 4119.

Rate of issue of drafts, viz.: 1*s.* 3$\frac{3}{4}$*d.* per rupee for sterling drafts, and 1*s.* 4$\frac{1}{16}$*d.* per rupee for rupee drafts, (*Lindsay*) 3380, 3382–3, 3405–34, 3531–2, 3718–28, 3748–50, 3852–3, 3923–4, 3942, 4002–4, 4062, 4171, 4252–4, 4269–70; (*Vincent*) 5490, 5496–7, 5509–10, 5560–2; (*Ralli*) 6118; (*Steel*) 7167–8; (*Rothschild*) 7614, 7629, 7635, 7638, 7645–8; (*Adam*) 7784–801; (*Cruickshank*) 9387, 9647–9; (*Farrer*) 12,227–36.

Sale of Council bills, (*Lindsay*) 3424–6, 3774–87, 3877–84, 3944–60, 4050–1, 4121, 4176; (*Adam*) 7826–7; (*Coke*) 8034–5.

Similar scheme suggested for Ireland by Parliamentary Committee in 1804, (*Lindsay*) 3368–78.

Supported by practice of Scotch banks from 1763, (*Lindsay*) 3360-7, 3745–7, 3872–6; (*Macleod*) 12,937.

Loanable capital, limited sources of supply in India, (*Arthur*) 1691–6.

,, ,, scarcity of, since 1893. *See* "Stringency."

Macleod (Mr. H. D.): scheme for establishing a gold standard and gold currency in India, (*Macleod*) 12,944–85.

Madras, public opinion in, as to closing of mints, (*Mackay*) 47, 690–1.

Manchester Chamber of Commerce, views on currency question, (*Adam*) 7748–9, 7776, 7781, 7811–7, 7889, 7894, 7896; (*Barclay*) 11,534, 11,578–80, 11,738–46.

Manchester goods, imports of, (*O'Conor*) 1413–7; (*Ralli*) 6127; (*Adam*) 7807; (*Graham*) 9133–5.

Mauritius, alleged want of currency in, (*Christie*) 4775–9; (*Ralli*) 5929–30, 6055–7, 6077–86.

Melting of rupees, (*Harrison*) 2427–33.

,, ,, by Government. *See* "Gold Standard, Proposals of Government of India."

Mexico, currency of, (*Ralli*) 6310; (*Giffen*) 10,111.

Mints of Government of India. *See* "Closing of Indian Mints" *and* "Reopening of Mints."

Mints of Native States, (*O'Conor*) 1102–3, 1165-7, 1205; (*Finlay*) 2956–8; (*Lindsay*) 4076; (*Barclay*) 11,667–84; (*O'Conor*) 12,022–42.

Monetary Conference at Brussels in 1892, (*Mackay*) 23-9.

,, ,, at Paris in 1881, (*Mackay*) 12.

Money-lending in India (*MacDonnell*) 5753–9; (*Raphael*) 6569; (*Steel*) 7329, 7348. *See also* "Indebtedness of Indian cultivators."

Native banking system in India, (*Mackay*) 276–7; (*MacDonnell*) 5759.

Native States, attitude towards proposals for gold standard, (*Finlay*) 2962.

,, ,, mints of. *See* "Mints of Native States."

Notes: suggestion that Indian currency notes should be payable in gold, (*Montagu*) 6721, 6745–50; (*Rothschild*) 7702, 7735–7; (*Northbrook*) 8438–40, 8467–72, 8493–4, 8518–22, 8533–4, 8560–3; (*Darwin*) 12,567, 12,597, 12,599–614, 12,690–2.

,, *See also* "Bank of England Notes" and "Currency Note Circulation."

Opium, price of, (*Mackay*) 118–20, 123, 257, 540–2; (*Cruickshank*) 9426; (*Duncan*) 11,900, 11,966–73; 12,009 (*note*); (*O'Conor*) 12,010-2, 12,014.

,, trade, (*O'Conor*) 1420–3, 1558–63; (*Steel*) 7205, 7276–9; (*Northbrook*) 8401; (*Cheetham*) 8698–701; (*Graham*) 9047–9, 9231; (*Mackenzie*) 10,426–7; (*O'Conor*) 12,010, 12,013, 12,058; (*Macdonald*) 12,363–6, 12,515–7.

Ornaments, gold, use of, (*Probyn*) 6919–21, (*Rothschild*), 7673–5, 7681.

,, silver, price of. *See* "Silver."

,, ,, sale of, during famine, (*Mackay*) 163–76, 695–7; (*MacDonnell*) 5767–9, 5836–42; (*Mackenzie*) 10,391; (*Dutt*) 10,841–4, 10,867–76, 10,882–4; (*Barclay*) 11,612.

,, ,, taken to mints before 1893, (*Mackay*) 162–3; (*MacDonnell*) 5765–6.

,, ,, use of, (*O'Conor*) 912–8; (*MacDonnell*) 5769, 5885; (*Northbrook*) 8444; (*Galloway*) 9910; (*Mackenzie*) 10,391; (*Dutt*) 10,856; (*Barclay*) 11,582–4.

,, use of rupees as, (*Lindsay*) 3865, 3869–71, 4228–31; (*Galloway*) 9911; (*Mackenzie*) 10,392.

Paper money, use of, in India, (*Lindsay*) 3607, 3997, 4163; (*Probyn*) 6986–7; (*Rustomjee*) 9867–8; (*Darwin*) 12,638–9.

Plague in India, effect of, on trade, (*Mackay*) 796; (*O'Conor*) 836.

Planters of Southern India opposed to closing of mints, (*Mackay*) 52, 57–9.

Population of India, (*O'Conor*) 1189, 1213–5, 1573–5.

Poverty of India, alleged, (*Arthur*) 1689–95, 1748, 2007; (*Northbrook*) 8447; (*Giffen*) 10,113, 10,238–48; (*Marshall*) 11,793.

Presidency banks, balances of, (*Lindsay*) 3288, 3311–20, 3437–40, 3638–49, 4131–8; (*Northbrook*) 8450–1.

,, ,, Suggested amalgamation of. *See* "Bank of India."

Prices:

(1.) Connection between rupee prices and sterling prices, (*Mackay*) 128; (*O'Conor*) 850–3, 1035–9, 1082; (*Arthur*) 2084–6; (*Graham*) 9168, 9170; (*Cruickshank*) 9390; (*Marshall*) 11,772, 11,788–90.

(2.) Connection between rupee prices and rate of exchange, (*Mackay*) 129–31; (*O'Conor*) 846–9, 1040–1, 1304, 1493; (*MacDonnell*) 5812; (*Ralli*) 5947, 6257–84; (*Steel*) 7097, 7099–101, 7349; (*Acworth*) 7494–6, 7530–2, 7605–9; (*Adam*) 7911–6; (*Cheetham*) 8839–42; (*Graham*) 9053, 9058, 9170; (*Cruickshank*) 9390; (*Giffen*) 10,286–7; (*Mackenzie*) 10,508–9; (*Dutt*) 10,643–8, 10,654–5; (*Lubbock*) 11,053.

(3.) Connection between sterling prices and rate of exchange, (*Arthur*) 1746–7, 1938–47; (*Lindsay*) 3823, 4296–7; (*Adam*) 7833, 7996; (*Coke*) 8043, 8122–5; (*Graham*) 9160, 9171–3, 9237–42; (*Cruickshank*) 9560; (*Farrer*) 12,197–8.

(4.) Effect on prices in India of closing of mints and introduction of gold standard, (*O'Conor*) 1467; (*Arthur*) 2176; (*Finlay*) 3195–8; (*Lindsay*) 3961, 3973, 3985–7, 4119; (*Northbrook*) 8396; (*Graham*) 9198–9; (*Cruickshank*) 9453–6, 9465–6.

(5.) General movements of prices in India, (*Mackay*) 112–4, 124–5, 538–9, 631, 636–8; (*O'Conor*) 1171, 1357–61, 1603–4; (*Finlay*) 2789–93; (*MacDonnell*) 5772–4, 5777, 5808–9, 5813–22, (*Acworth*) 7478–9; (*Graham*) 9080–3, 9088, 9321–34; (*Cruickshank*) 9535–49, 9680–90; (*Marshall*) 11,770—2, 11,799; (*Duncan*) 11,864–7, 11,872–4; (*O'Conor*) 12,143–51.

(6.) Influence of prices on rent, (*MacDonnell*) 5748–9; (*Northbrook*) 8582.

(7.) Price of opium, (*Mackay*) 118–20, 540–2.

(8.) Price of silver. *See* "Silver."

(9.) Prices of exports, (*O'Conor*) 850, 996–7, 1034; (*Marshall*) 11,772.

(10.) ,, food-grains, (*O'Conor*) 850, 883, 893–5, 1492–4; (*MacDonnell*) 5722–8, 5744, 5799, 5824–7, 5900; (*Acworth*) 7524–9; (*Cheetham*) 8732; (*Graham*) 9080–3; (*Cruickshank*) 9541–6; (*Mackenzie*) 10,335, 10,501, 10,545 10,626–7; (*Dutt*) 10,648, 10,651–3, 10,658–70, 10,948–69; (*O'Conor*) 12,143–4.

(11.) ,, imports, (*Mackay*) 126–7; (*O'Conor*) 1495; (*Acworth*) 7419–25, 7543–9; (*Marshall*) 11,772.

(12.) Relation between volume of currency and prices, (*Lindsay*) 4190–9; (*Giffen*) 10,118–23, 10,192–6; (*Marshall*) 11,759–62.

No. 1.

LETTER from the MADRAS CHAMBER OF COMMERCE.

The Chamber of Commerce,
Madras, 19th May 1898.

SIR,

I HAVE the honour to state that the Madras Chamber of Commerce has taken into earnest consideration the Government of India's Notification Accounts and Finance / Mint, No. 2048 A., dated 4th May 1898, published in a *Gazette of India Extraordinary* of the same date, containing papers on the subject of the establishment of a gold standard in India, and setting forth the Government of India's proposals with regard to the same. The Chamber considers it to be its duty to lose no time in laying before the Indian Currency Committee its strong disapproval of these proposals and its reasons for this disapproval. The Chamber is astonished to find that in the face of what has occurred during the last two years, and especially during the last six months—namely, the extreme stringency of the money market, and the universal outcry and demand for the adoption of measures to relieve this stringency—the Government of India should now put forward proposals involving the immediate withdrawal of ten crores of rupees from the currency, of which six crores are to come from the outside public. The Chamber cannot understand how Government has failed to see that to carry out such a scheme would in all probability cause a most serious financial crisis and widespread ruin.

2. The Chamber observes that Government chooses to assume *ab initio* that the currency at present is unduly redundant; but this hypothesis the Chamber cannot accept. It would remark, however, that one advantage of the Lindsay scheme, which Government has rejected, is, that it would leave to natural causes to show whether this is or is not the case. If it is, then under the scheme rupees would flow in gradually probably and automatically, to buy gold at the Government minimum of 1*s.* 3$\frac{3}{4}$*d.*, and when they reached a certain amount they might, if necessary, be legitimately melted and sold for gold to replace the gold reserve. The Chamber's belief, however, is that there is no redundancy of currency, and that as soon as confidence in the efficacy of the Lindsay scheme was established, which the Chamber believes would not take long, gold would flow in which could be used not to attempt the Sisyphean task of establishing and maintaining a gold coinage, but to buy silver for coinage to replenish what would have been found to be the unduly contracted currency.

3. It seems to the Chamber that the dominant note throughout the whole of the Government Despatch of the 3rd March is that the volume of the currency must be made to be consistent with a 1*s.* 4*d.* rupee, and that if it is not consistent with this it is redundant and must be contracted. But the Chamber ventures to think that a sounder argument is the volume of the currency must be consistent with the requirements of trade and the prosperity of the country, and to endeavour to secure a 1*s.* 4*d.* rupee at the expense of these would be an unwise and fatal policy.

4. It has already been proved that by the artificial contraction of the currency exchange can be temporarily forced up to the 1*s.* 4*d.* level; but so far this has worked not good but evil, for no one believes—or will believe until a minimum is established—in the stability of exchange, and consequently capital has flowed from, instead of to, the country ever since the maximum rate was reached. If the Government proposals were adopted no doubt for a time exchange would be kept at 1*s.* 4*d.* by the undue contraction of the currency which they involve and the extreme stringency of money which would prevail; but no confidence would be created. Rather the reverse, as public opinion would not tolerate permanently the evils flowing from a contracted currency.

5. The following figures will show the large withdrawals of capital from India which have necessitated the high bank rates ruling during the past two yeasr The figures are taken from the last published statements of the Presidency Banks in March 1896 and March 1898, which may be taken as the height of the busy season :—

——	Government Deposits.	Other Deposits.	Advances.	Cash.
1896 -	407,00,000	1,135,00,000	1,268,00,000	542,00,000
1898 -	368,00,000	886,00,000	1,106,00,000	387,00,000
Decrease	39,00,000	249,00,000	162,00,000	155,00,000

These figures speak for themselves; and when it is considered that at the end of March 1898, the ordinary surplus balances of the Government in their Reserve Treasuries in Calcutta, Madras and Bombay, apart from the balances with the Presidency Banks, amounted to over three crores, it is evident that these balances which are taken by the Government from their revenue collections are kept locked up to increase stringency and thereby force up exchange.

6. The Government objects to the Lindsay scheme on account of its possible expense. The Chamber is confident that to establish permanently a gold coinage on the lines of Government's scheme would cost far more than the 20,000,000*l.* that Government contemplates, and that to carry out the Lindsay scheme 20,000,000*l.* would be more than sufficient. Moreover the Chamber believes that a large majority of authorities in India consider that a gold coinage is unsuitable to this country, apart from the probably enormous expense of establishing it.

7. Another objection to the Government scheme is that to throw at once a huge quantity of silver on the market would further reduce the price of that metal, thereby seriously injuring both producers in their competition with silver standard countries and the great mass of holders of silver in India.

8. In conclusion, the Chamber would again advocate the adoption of the Lindsay scheme or some modification of it for the reasons already stated in its letter to the Government of India, which is quoted on page 9 of the *Gazette Extraordinary* of the 4th May, and would respectfully press on the Currency Committee the urgent necessity for the prompt adoption of measures to relieve the present tension in India, which is universally felt to have become intolerable.

9. I have the honour to confirm the following telegram despatched by the Chamber to the Committee on the 17th instant :—

> "Madras Chamber of Commerce strongly protests against adoption Government India Currency proposals involving violent contraction currency which disastrous to trade necessities and prosperity country. Approves Lindsay scheme or modification. Letter follows."

I have the honour to be,
Sir,
Your most obedient servant,
(Signed) GEORGE G. ARBUTHNOT,
Chairman.

To the Secretary,
Indian Currency Committee,
India Office, London.

No. 2.

LETTER from the BENGAL CHAMBER OF COMMERCE.

Bengal Chamber of Commerce,
Royal Exchange Building, Calcutta,
16th June 1898.

SIR,

I AM directed by the Committee of the Bengal Chamber of Commerce to address you with reference to the proposals of the Government of India for the establishment of a gold standard in India, as set forth in Despatch No. 70 of 3rd March 1898, from the Government of India, Finance and Commerce Department, to Her Majesty's Secretary of State for India,

published with accompanying papers in the *Gazette of India Extraordinary*, dated Simla, 4th May 1898.

2. In view of the paramount importance of the establishment of a sound currency system in India in the interests of trade and commerce, and of the country generally, the Committee lost no time in placing the proposals of the Government of India before their members for their consideration. So far as the Committee have been able to ascertain the opinions of members, they are almost entirely opposed to the introduction of the scheme which has been submitted to the Secretary of State by the Government of India. Although a considerable number of the members of the Chamber are not prepared, for various reasons, to express their opinions on currency matters, the Committee feel they are justified in taking those they have received as fairly representing the views of the majority of members with regard to the Government proposals. The Committee now direct me to refer more particularly to those points in the scheme which appear to members to be open to grave objection.

3. Before, however, proceeding to do this, I am instructed by the Committee to draw attention to certain statements made by the Government of India in their communications to the Secretary of State which, they think, are calculated to convey an erroneous impression with regard to the attitude taken by this Chamber. The first of these is contained in paragraph 26 of the Despatch already alluded to, in which the Government of India write as follows, in respect of letters addressed to them by the Bengal, Bombay, and Madras Chambers of Commerce:—"We think, there-"fore, that we may expect their support in the "measures we propose, though neither the Bengal "Chamber nor the Bombay Chamber has declared in "favour of any particular scheme to secure the object, "and the Madras Chamber has supported, with some "modifications, the proposals of Mr. Lindsay to which "we allude below."

As a matter of fact the Bengal Chamber of Commerce has always carefully refrained from either proposing, or supporting, any particular scheme for solving the currency difficulty. This attitude has been taken up by the Chamber in consequence of the great diversity of opinion among its members. At the same time, although members are divided as to the best course to be pursued to set the currency of the country on a sound basis, they are, so far as their views are known, practically unanimous in condemning the proposals now put forward. In this connexion I am also instructed by the Committee to refer to a statement, in paragraph 2 of Despatch No. 92 of 24th March 1898, from the Government of India, Finance and Commerce Department, to the Secretary of State for India, in which the Chamber is again committed to an opinion on mistaken grounds, an address delivered by the Hon. Mr. Allan Arthur, the then President of this Chamber, at the annual general meeting of members held on the 28th February last, being quoted as an expression of opinion on the part of the Chamber. It is understood, under the rules of the Chamber, that the remarks of the President, in his annual address, shall not be taken as necessarily representing the views of the Chamber.

4. The principal basis of the proposals made by the Government of India for the establishment of a gold standard, appears to be indicated in paragraph 9 of the Despatch of 3rd March in which it is laid down that one of the main reasons of the failure to accumulate that reserve of gold which is a necessary preliminary to the establishment of a gold standard is that "our "rupee circulation had, before the closing of the "Mints, been increased to such an extent that it fully, "and more than fully, supplied all the demands of "trade, and allowed no room for any further addition "in the form of gold." The Government of India consider that "the remedy for this state of things is "to remove from circulation as money, so much of the "increases which were made to the circulating medium "immediately before 1893 as we may find to be "redundant," and they propose to do this as indicated in paragraph 11 of the Despatch, by melting down existing rupees, having first provided a reserve of gold for the double purpose of taking the place of silver, and to establish confidence in the issue of their measures. The proposals, stated briefly, are to melt down annually, until such time as the object sought for shall be attained, 10 crores of rupees of coined silver, placing the same upon the market for sale, and to reduce by this amount the actual rupee circulation of the country, an operation which Government do not regard as likely to have any important permanent effect on the silver market adding, "even if we were "under any obligation to give weight to such con-"sideration." This proposal is viewed with alarm and mistrust by members of this Chamber. It is felt that the currency is already sufficiently contracted, and that further contraction with the continued scarcity of loanable capital, cannot fail to raise the rates of interest—already abnormally high—in India. The high rates of interest which have ruled for prolonged periods in each of the last two years, have proved not only a serious inconvenience, but a hindrance to trade, more especially internal trade, and if such conditions continue, and become intensified, there is every reason to fear that commercial disaster may ensue.

5. The opinion of the Government of India that the annual sale of six crores worth of silver will not have any important permanent effect on the silver market, has been received with surprise in mercantile circles. The general opinion appears to be that such an operation would be almost certain to lower the price of silver, including the silver in the hands of the natives of the country. This further depreciation of silver, while the nominal value of the rupee remains at 16*d.*, must increase the divergence between the exchange value and the metallic value of the rupee, and, in the opinion of producers generally, it would seriously affect the trade of India with silver countries direct, and with gold countries in competition with silver currency countries.

6. After a careful perusal of the Government scheme, the Committee cannot trace in it any guarantee for the future convertibility of the rupee, notwithstanding that the main object of the Government policy is, presumably, to secure fixity of exchange. Under these circumstances it is felt very strongly that the proposals of the Government will fail to inspire that confidence in the future of exchange, which it is absolutely necessary should exist, if the evils resulting from the proposed forced contraction of currency, which have been already alluded to, are to be minimised by the introduction of fresh capital into the country. The Committee while fully recognising that the attainment of fixity of exchange is an object of primary importance in the interests of the Government finance, and of foreign trade, are of opinion that it is equally necessary that the supply of currency should be automatically responsive to the current requirements of trade.

7. The Committee note that the proposals of the Government of India include not only the introduction of a gold standard, but also the establishment of a gold currency; although in paragraph 30 of the Despatch of 3rd March, it is stated that the actual issue of gold coins by Government is not contemplated, either for Treasury purposes, or in payment of currency notes, until the measures taken actually result in the establishment of the value of the rupees at 16*d.*, and the use of sovereigns to some extent, however small, as a permanent part of the circulation. In the opinion of many members of this Chamber a gold currency is entirely unsuited to the requirements of this country, and from the terms of the Despatch the Government of India themselves appear to regard it in the light of an uncertain experiment surrounded with difficulties which are not likely to be solved for a considerable time.

8. In conclusion the general opinion of the mercantile community of Calcutta, so far as the Committee have been able to ascertain it, is that the cost of the measures proposed by the Government of India would be much greater than is estimated, that the period of transition would be indefinitely prolonged, and that the result would, for many years to come, diminish rather than strengthen, confidence in the minds of English capitalists and investors.

I have, &c.

W. Parsons,
Secretary.

To Robert Chalmers, Esq.,
Secretary to the Indian Currency
Committee, London.

No. 3.

Letter from the Bombay Chamber of Commerce.

Sir, 17th June 1898.

I have the honour, by direction, to wait upon you with a copy of a letter addressed by the Committee of the Bombay Chamber of Commerce, to the Government of Bombay, on the subject of the Indian Currency,

which I have to request you to lay before the Indian Currency Committee.

I have, &c.
JOHN MARSHALL,
Secretary.

Robert Chalmers, Esq.

Enclosure to No. 3.

Chamber of Commerce,
Bombay, 6th June 1898.

SIR,

UNDER date of 2nd March 1898 I had the honour to lay before you, for the information of the Government of India, the views which this Chamber entertained respecting the unsatisfactory position of the currency and the critical state of financial pressure throughout the country, and advocating as the most desirable means of ascertaining and deciding upon sound remedial measures the appointment of a Committee of Inquiry on the lines of the Herschell Committee of 1893.

2. Since then the Government of India's despatch to Her Majesty's Secretary of State for India, dated 3rd March 1898, has been made public, and to consider the proposals therein submitted a Committee has been appointed, which (although the terms of reference, especially as to the possibility of a return to the silver standard, are less explicit than this Chamber would have desired) nevertheless practically meets its suggestion.

3. On the proposals embodied in that despatch the views expressed in anticipation in my letter of 2nd March render detailed criticism unnecessary, but lest it might be assumed that the arguments adduced by the Government of India in support of their proposals had in any way affected or modified those views, I am directed to state that, far from supporting, as the Government of India anticipated, the measures for securing stability of exchange proposed in their despatch, or believing that the adoption of those measures would have the effect of overcoming the distrust on the part of the public in the future of the rupee, this Chamber is diametrically opposed to the views expressed in the despatch and to the principle on which the Government of India's proposals are based, namely, forced contraction of the currency.

4. The Chamber cannot but view with the gravest apprehension a proposal to melt down the existing currency until it becomes "even at the most inactive time of trade" inadequate for the ordinary requirements of the country in the expectation that gold will thereby be forced into circulation.

5. The Herschell Committee in recommending that rupees should be given in exchange for gold at a fixed ratio relied upon this measure as "leaving the volume of rupee currency dependent on the wants of the people of India," but the experience since gained, especially during the last five months, has shown that this provision for the expansion of the currency has been practically inoperative in spite of the great strain the money market has undergone, the reason being, the Chamber submits, that as the ratio at which gold is exchangeable for rupees fixes the maximum gold value of the rupee and no guarantee is given of its minimum value, gold will never be tendered until all other possible means of finance have been exhausted. The conclusion which this Chamber draws is that gold can only, if at all, be introduced into circulation under conditions of the money market which are ruinous to both foreign and internal commerce, and can only be retained in circulation so long as those conditions are maintained.

6. The Government of India rely upon the exigencies of an expanding trade to force gold into circulation by refusing the country a sufficiency of the currency to which it is accustomed, but although trade under favourable circumstances may be expected to expand, there is nothing more necessary for its development than a free and natural supply of currency regulated automatically by its varying requirements, and it seems to the Chamber quite as likely that a contraction of trade will follow a contraction of the rupee currency as that the necessities of trade will compel the adoption of a currency to which the country is unaccustomed and which, in the opinion of this Chamber, is unsuited to its requirements.

I have, &c.
JOHN MARSHALL,
Secretary.

The Secretary to Government, Financial Department, Bombay.

No. 4.

LETTER from the KARACHI CHAMBER OF COMMERCE.

The Chamber of Commerce,
Karachi, June 29, 1898.

SIR,

I HAVE the honor to state that the proposals for the establishment of a gold standard in India, set forth in the Government of India's despatch to the Right Honorable the Secretary of State for India, No. 70, of the 3rd March 1898, have received the earnest consideration of the Karachi Chamber of Commerce.

2. In the despatch above referred to, the Government of India anticipate with some confidence that the measures proposed will meet with the approval of the Commercial Community. Lest silence should be taken as an indication of assent, I am directed to inform you that, so far from approving of the proposals now put forward, this Chamber regards them with the most serious misgivings. Not only does the suggestion to arbitrarily melt down twenty-four crores of rupees appear to be diametrically opposed to all sound monetary precedent, and fraught with the gravest danger to commerce, but it is not apparent to the Chamber, considering the amount of gold available for permanent export to the East, how the deficiency is to be filled, or whence the new gold is to be obtained, for the establishment of the proposed standard. The City of London has already given expression to its disinclination to support any loans for such purposes, and without a free importation of gold, and a large reserve of the metal in this country, the possibility of the Government of India maintaining a gold standard appears open to serious question.

3. Further, it is not at all clear that an alteration in India's monetary standard is urgently called for. This Chamber, whilst recognising the inconveniences to commerce consequent upon fluctuations in the gold-value of the rupee, is unable to discover that the trade of India has been retarded thereby. It is therefore difficult to believe that the condition of India is such as to justify the means proposed by the Government of India for the introduction of a gold standard, however desirable and feasible such a standard might be under more favourable circumstances.

4. In conclusion the opinion of this Chamber is that the propcsals of the Government of India tend to still further destroy confidence in the minds of capitalists and investors, an opinion which is shared by the whole Mercantile Community of India, as evidenced by the memorials recently published on the subject, by the Chambers of Commerce of Bengal, Bombay, and Madras.

I have, &c.
(Signed) T. R. McLELLAN,
Chairman.

Robert Chalmers, Esq.

No. 5.

LETTER from the BOMBAY NATIVE SHARES, STOCKS and EXCHANGE BROKERS' ASSOCIATION.

To the Right Honourable SIR HENRY FOWLER,
Chairman of the Indian Currency Committee.

THE Despatch No. 70, dated the 3rd March 1898, of the Government of India to Her Majesty's Secretary of State for India carries such wide-reaching consequences to the industries and trade of this country, that I am directed by the Committee of the Bombay Native Shares, Stocks and Exchange Brokers' Association to address the following observations thereon to the Currency Committee appointed by the House of Commons at the instance of the Secretary of State for India.

2. All parties in this country are agreed, including the Chambers of Commerce and the Government of India, that the transition period of the limping standard is intolerable, and should be soon put an end to, either by the adoption of the gold standard or reverting back to the silver standard. Yet the Government of India in their despatch propose to protract the agony in an intensified form for a further period of two, three, or four years, as an experiment, without the promise of a finality, which should be the sole object of any further legislation.

3. My Committee, with the utmost deference, and after due consideration, submit that the Government of India in their despatch under observation have made large assumptions, and have ascribed effect to causes

not altogether the right ones. The Government of India in para. 9 of their despatch state: "Our "total rupee currency is estimated to be at present "somewhere about 120 crores, to which we have to "add 10 crores of fiduciary circulation of currency "notes. This amount may, therefore, be said to have "been ascertained by experience to be *much more* than "is consistent with a maintenance of a rate of sixteen "pence in the season of inactive trade, and to be a "*little more* than is consistent with that rate at the "time of active trade." Dominated by such an idea the Government of India has proposed to melt down about 20 crores rupees in two or three years, or more if necessary, to reduce the great redundancy of rupee currency. This has set the people conjecturing as to what should constitute a monetary stringency according to the notions of the Government of India; for from November 1896 to July 1897 the Presidency Banks' rate ruled from 8 to 12 per cent., and again from December 1897 up to date has ruled from 10 to 13 per cent. Even these rates were more or less nominal, for more often than not the Presidency Banks have absolutely refused to make advances at all, even on Government paper and gold, at any rate of interest. Natives who had in recent years taken more kindly to investment in Government paper as a safe and liquid security, on which they could confidently rely for accommodation in times of pressure and difficulty, have found it during the last two years a broken reed. The result is that that security has declined 15 per cent. during the last 20 months. That no accommodation could be had during these periods of stringency on real property or other sound security goes without saying.

4. The assumption by the Government of India that by the combined effect of great stringency of money and curtailment of currency they will not only be able to maintain the rupee at 16*d.*, but will induce a flow of gold into this country to pass as currency during the melting period, and *after*, arises from a serious mistake, if not ignorance of the causes that govern exchange between the gold countries and India, tied down as she is at present with the limping standard. The exchange between a group of gold countries is determined by the rate of interest and the cost of freight, insurance and commission of remitting gold from one country to the other. The exchange between the gold and silver countries is determined by the price of silver in the market. But the exchange between gold countries and India with a limping standard is determined by exports and imports alone. Whether the exchange should rule high or low, near to or further from 16*d.*, depends on the amount of the excess of the exports over the imports. In order to keep exchange somewhere in the neighbourhood of the legal maximum, 16*d.*, India should export produce and raw and manufactured goods more than she imports them by the sums equal to (1) Secretary of State's drawing; (2) about 10 crores for payment of gold and silver for arts and ornaments; and (3) about five to six crores of private remittances. But as these adjustments could *not* be made month by month and day by day, the rate of exchange will generally be at its maximum between January and June, when the exports vastly preponderate over the imports; and it will be at its minimum between July and December, when the imports preponderate, tempered by the state of the rains throughout the country and an anticipation of the character of the busy season in respect to the other markets of the world. Stringency of money has absolutely nothing whatever to do in the determination of exchange with India. Stringency could only be relieved by the import of foreign capital; and who will venture to remit capital to this country without the assurance of its return without loss? Given the condition of a great stringency of money, the curtailment of currency by melting down to half, and a 20 to 30 per cent. bank rate of interest; and yet if the excess of the export over the import of produce is not more than say 15 crores, which are sufficient to pay only for the import of precious metals and private remittances, but which leave no margin to pay the Secretary of State's drafts, then India must either borrow in sterling to pay her foreign indebtedness amounting to 17 or 18 millions sterling, or the exchange must drop to the silver point. There may be years when the exports of goods are equal to the imports of goods, or even less, as it sometimes happens with the United States of America, and the borrowing to pay our indebtedness may in such years be even found too large for India.

5. When the Government of India attribute the rise of exchange to its present level and state the principle in the para. 2 of their despatch, "that the contraction in "the volume of our silver currency, with reference to "the demands of trade, has the direct effect of raising "its exchangeable value in relation to gold," they either labour under a serious mistake or ignore the facts patent to all. The causes of the rise of exchange to its present level are the large borrowings in England by the suspension of Council Bills, and a large railway programme since the closing of the mints, and thereby increasing for the time the balance of trade in India's favour. The fall of exchange to silver point was arrested during the years 1893-94 by the suspension of Council Bills, and by large sterling borrowings in England. The rise of exchange during the years 1896-98 is owing to the further suspension of Council Bills owing to famine and war, which made necessary further large sterling borrowings. The borrowing since the closing of the mints must have been over 25 millions sterling. If the rate of exchange is maintained for the last six months in the neighbourhood of 16*d.* it is owing to the earlier borrowings, and the vast preponderance of the export over the import owing to the most bountiful harvests in India, and the world wanting all our surplus produce at high prices.

6. The stringency of money has not helped exchange. The causes of the present stringency are (1) large withdrawal of floating foreign capital at the maximum rate of exchange; (2) the lock-up of rupees received for revenue in Government treasuries. Both these causes would have weakened exchange, were it not for the present great preponderance of the excess of the exports over the imports. The first by buying for remittance; and the second by clogging and hampering the free flow of produce for export to the sea-board which makes the sales of Exchange Bills. The exchange has therefore remained strong, not because of the great stringency, but in spite of it. From middle of June, when Government treasuries are being emptied by disbursements, and vast sums sent up-country for the payment of produce return to Presidency towns for the purchase of precious metals, piece-goods, machinery and tools from foreign countries, thereby making the imports larger than the exports, the exchange will decline. It will not because of the redundancy, but because of the trade-wheel turning the other way. Last month, when the Finance Minister refused to lend to the Bank of Bombay on Government Paper to finance the internal trade of the country for the reason that the Secretary of State was prepared to sell all that was asked, he lost sight of the fact that foreign trade and inland trade are distinct and apart. The middleman who wants money to bring the produce from the interior to the sea-board to sell to the exporters, has no gold reserve in London to buy Secretary of State's drafts; but he has Government securities, property and produce, which the artificial policy of the Government made unborrowable and unsaleable.

7. The proposal of the Government of India to melt rupees and sell as silver, will keep exchange steady in the neighbourhood of 16*d.* only during the period the process lasts. But that will not be owing to the curtailment of currency, but to the prohibition of the import of foreign silver by the Government underselling all-comers and thereby increasing the balance of trade in India's favour. The Government of India seem to see the force of this dimly in the para. 15 of their despatch, which runs: "We may observe that "our proposed selling of silver in addition to its direct "effect on the rate of exchange would also have a not "unimportant indirect effect, inasmuch as the operation would meet the demand for silver in India, and "thus increase for the time the balance of trade that "has to be discharged by Council Bill remittances." If the word "*direct*" were substituted for the word "indirect" it would exactly meet the contention. But at the end of three years, or rather at the end of the period of process of melting, as the Government do not promise nor intend to give a sovereign for every 15 rupees, the fluctuations in exchange will be restored to the same state as before the declaration of war against the so-called redundant currency. The time the Government experiment lasts will be utilised not to bring fresh capital into this country, but to convert as much as possible foreign capital employed in this country into gold or to put it on a gold basis. Banking and investing capital is very timid, and trusts only to the certainty that it should not suffer in bulk when returning; and that certainty could only be had by the Government of India undertaking an unlimited liability like the Government of the United States of America.

8. The sale of the metal melted from every 10 crores of rupees would not bring to the treasury the six crores of rupees the Government of India estimate. India

eliminated from the market of the world as a large and every-day buyer of silver, must bring the price of that metal down to 20 pence or even lower. But the loss of a few crores more or less, to use the phrase of the Despatch No. 70, "is a subordinate matter," compared to the revolution our trade with China would undergo by a further fall in exchange of 20 or 25 per cent. The further diminution that our already dwindling opium revenue will suffer, although it may be a source of satisfaction to the purists, yet it will be a grim reality to our ryots. The largest excess of export over import which enables us to pay our foreign debt is derived from our trade with China and the East. Government should foster it and not kill it. Why lop off the branch that gives us the greatest support?

9. As the whole scheme of the Government of India is based on wrong hypotheses, the accumulation by borrowing 20 millions sterling in gold in the treasury of the Government will only entail heavy charges in interest without bringing us any nearer to a gold standard. This gold is to be kept intact and apart, for the Government say "it is not our intention to part "with any of the gold until" a gold circulation is established by capital flowing into this country in blind faith in the scheme of the Government of India. Capital could have no faith in a scheme in which the authors of the scheme have none.

10. In the opinion of my Committee a gold standard could only be established in this country either by the Government of India accumulating large reserves of gold, and by undertaking an unlimited liability to exchange gold for rupees, or by the Government of the United Kingdom undertaking a liability to allow rupees to circulate in England at 16 pence. But as neither is immediately practicable, the scheme associated with the name of Mr. A. M. Lindsay and attached to the Despatch No. 70 offers a present solution. It involves no great accumulation of gold, and what it requires will be required tentatively and in driblets. Under the scheme, as the gold is not to be sent out to this country, it will raise no alarm or distrust of the banking classes in England. But this scheme also involves the Government of India in an unlimited liability which, according to Sir James Westland, they are not prepared to pay.

11. The proposal of the Government of India in their Despatch No. 70 is not a scheme, but an experiment; and we want no further experiments in currency. The traders of this country since 1873 have accustomed themselves to suit their business to the great fluctuations of exchange; and until a final scheme is evolved, they would rather prefer to work under the limping standard, tempered by the Government of India allowing the use in the busy season of the surplus funds accumulated in the treasuries by the collection of revenues. The gaze of the Government of India does not soar beyond the 16*d.* rate of exchange. But exchange is not the country. The experiment of the Government of India is bound to fail, for the hypotheses and reasons on which it is based are wrong; but whether it succeeds or whether it fails, the period during which the experiment lasts, will be one of great tribulation to this country, and will spell ruin to all existing industries. The promotion and carrying out of all enterprises will remain in suspense, the credit of the Government Paper will sink to the lowest depth, and no trade could be carried on profitably under the chasm created by melting down 200 millions of rupees.

Your obedient Servant,
S. B. BROACHA,
Chairman of the Bombay Native Shares, Stocks and Exchange Brokers' Asssociation.

Bombay, May 28, 1898.

No. 6.

LETTER FROM BENGAL COTTON SPINNERS.

To the Right Honourable SIR HENRY FOWLER, M.P., President of the Indian Currency Commission.

SIR, Calcutta, 31st May 1898.

WE, the undersigned, represent 60 per cent. of the cotton spinning industry of Bengal.

In the hope that the early expression of the views of every section of the Indian mercantile community may be of value to your Commission we to-day telegraphed as follows:—

> Undersigned representing principal cotton mills Bengal consider proposed currency measures fatal to their trade emphatically protest Kettlewell Yule Kilburn.

We do not attempt in this letter to explain how and why we have arrived at the opinion thus briefly expressed, but are ready to give our reasons if called upon to do so.

Neither do we touch on the vaster issues of the effect of the past and proposed action of the Indian Government in respect to currency on the prosperity of India generally.

We record our opinion as to the effect of this policy only on our own industry, which is the manufacture of cotton into yarn and the sale of the same to dealers in this country and to importers in China.

We, however, beg that our opinion may be regarded as the result of many years' thought and experience.

We believe that the trade which we in part represent was seriously injured when Government in 1893 destroyed the old and simple basis of value and contract and substituted the uncertain and complicated one since in use.

We believe that the measures now proposed by Government will cause further and incalculable injury to our trade both locally and with China.

From our point of view we consider that the wisest and safest course may be found in the admission by the Indian Government of failure of the present system, and in the adoption of measures by which, with as little dislocation of trade as possible, India may once more attain the safety of a free silver basis of value.

We have the honour to be,
Sir,
Your obedient Servants,
For the Bengal Mills Company, Limited,
ANDREW YULE & Co.,
Managing Agents.
For the Bowreah Cotton Mills Company, Limited, and for the New Ring Mill Company, Limited,
KETTLEWELL, BULLEN & Co.
For the Dunbar Mills, Limited,
KILBURN & Co.,
Secretaries.

No. 7.

LETTER from KOLAR GOLD FIELD MINING BOARD.

Oorgaum, South India,
SIR, 9th June 1898.

I AM directed by my Board to address you on the subject of the currency proposals now before your Committee, and to express to you its sense of the great burden laid upon the mining industry by the efforts of the Indian Government to maintain the rupee at its present fictitious value.

The gold mining industry, which I have the honour through my Board to represent, although it may be said to be still in its infancy in this country, has an embarked capital of two and a half millions sterling; and while it is evident that any measure tending by the creation of false standards to limit the purchasing power of gold must prove a serious discouragement to the industries dependent on the production of that metal, or on its employment in the form of capital, my Board goes further, and with the utmost deference submits that any such measure must therefore ultimately prove detrimental to the welfare of the country and to the development of its resources.

In order to prove that the burden of which we complain is not altogether an imaginary one, I may state that the money remitted annually to meet the expenditure of the mines represented by my Board is the sterling equivalent of, in round numbers, ten millions of rupees. Taking the intrinsic value of the rupee at 10*d.*, this should amount to 416,666*l.*, whereas the amount actually required to meet this remittance at the present artificial rate of 1*s.* 4*d.* per rupee is 666,666*l.*, or an excess of 250,000*l.* It will thus be seen that an industry which should receive the fostering care of all good government is being laid under contribution to the extent of a quarter of a million sterling per annum—or a first charge of 10 per cent. on its nominal capital—in

the support of a policy which is directly opposed to its own interests.

Although large employers of labour, my Board does not lay claim to represent any community, or to voice the sentiments of any section of the native public. It is, however, of opinion, that cheap capital and a natural exchange are the chief requirements of the people, and must eventually tend to the prosperity of the country.

I have the honour to be,
Sir,
Your obedient Servant,
ARTHUR LLEWELLYN,
Chairman,
Kolar Gold Field Mining Board.

To the Right Hon. Sir Henry Fowler,
Chairman,
Indian Currency Committee.

No. 8.

REPRESENTATIONS from the ASSAM BRANCH, of the INDIAN TEA ASSOCIATION.

Simla, the 4th August 1898.

MY LORD,

WITH reference to our Financial Despatch No. 70, dated the 3rd March 1898, we have the honour to forward copy of a letter from the Chairman of the Assam Branch of the Indian Tea Association, dated the 20th June 1898, protesting against the adoption of a Gold Standard in India, and suggesting the re-opening of our mints to the free coinage of silver.

2. There is a remark in the letter that the amount of spurious rupees in circulation in Assam will require the serious attention of Government. With reference to this we have to observe that we have not heard of any unusual amount of spurious coin circulating in Assam which requires serious notice. We may mention that the amount of counterfeit rupees cut and broken at treasuries in all India and in Assam during 1896 and 1897 were as follows:—

——	1896.	1897.
All India - - - -	11,431	15,343
Assam - - - -	162	203

It will be seen that there has been an increase in the number for the whole of India, but that the amount of the increase contributed by Assam is trivial.

The attention of the Chief Commissioner has, however, been called to the statement.

We have, &c.,
(Signed) ELGIN.
,, C. E. NAIRNE.
,, J. WESTLAND.
,, M. D. CHALMERS.
,, E. H. H. COLLEN.
,, A. C. TREVOR.
,, C. M. RIVAZ.

To
The Right Honourable
LORD GEORGE FRANCIS HAMILTON,
Her Majesty's Secretary of State for India.

Amgoorie, P.O.,
Assam, June 20th, 1898.

SIR,

WITH reference to Despatch No. 70, dated Calcutta, the 3rd March 1898, from the Government of India to Her Majesty's Secretary of State for India, I have the honour to lay before you the views of Tea Planters representing the Assam Valley.

1. We cannot help viewing with the greatest alarm the recommendation of the Government of India, that under the present contracted state of our currency, a sum of 10 crores of rupees or even more, should be annually abstracted from active circulation and melted down as a reserve to be held against note issue. Clause 12 of the Despatch states "that it will be seen "this proposal is no new thing, but one which has from "the first been advocated by the Government of India." We respectfully submit that the closing of the mints has already accomplished its object, as far as the Government of India is concerned, by placing its Revenue on a satisfactory footing, but this has been done at the cost of commerce and export trade. We cannot therefore see any reason for now introducing a method of still further increasing the present stringency of the money market, however necessary it might have been considered in 1893.

It has been very rightly stated that injury to trade cannot be allowed as an argument in favour of any measure, until the facts upon which it is based are produced. I trust therefore that the following summary of facts, brief though it is, may be accepted as a proof of the existing depressed state of trade generally, and especially of the Tea industry.

The Calcutta Tea market is regulated entirely by the London market, *i.e.*, if prices fall in London, there is an equivalent fall in Calcutta.

With exchange at 1*s.* 2*d.*, 1 lb. of tea sold at 8 annas in Calcutta is equivalent to 8.86 pence in London, that is taking freight, agency, and warehouse charges into account, but with exchange at 1*s.* 4*d.*, the equivalent of 8.86 pence in England is only 7 annas in Calcutta, and so it is that for every penny rise in exchange we, the producers, incur a dead loss of ½ anna per lb., or a little over six per cent. If there was a corresponding rise with exchange in the price of tea in London our position would be stronger, but unfortunately the opposite is the case; there has been for years a gradual fall in the value of tea, and this, coupled with the high bank rate, causes us no little anxiety as to the future of tea.

Charges connected with the manufacture of tea have been reduced to the lowest limit, and the margin left for a profit with exchange at 1*s.* 4*d.* is simply nil, except under particularly favourable circumstances in the matter of locality and labour.

Taking therefore the yield of Indian tea at 150,000,000 lbs. the loss to growers on every twopence rise in exchange would be over 7,000,000 rupees. The actual amount of loss as shown by the rise in exchange on 150,000,000 lbs. of tea would be a little over 9,000,000 rupees, but I have deducted 22½ per cent. for home charges in the case of tea sold in London (the balance of 77½ per cent. being remitted to India to cover cost in production) and I have also deducted 22½ per cent. for home charges from the realisation of teas sold in Calcutta.

The market value of last year's crop of tea represented about 8 crores of rupees and for the last eight years the average yearly increase in yield has been about 7,000,000 lbs., the additional capital required to meet such increase may be safely estimated at 4,000,000 rupees annually.

We fail to see that any successful attempt has yet been made to ascertain the amount of additional capital required to meet the increased demands for commercial industries in India and the increase of the population.

Anyone who takes a broad view of Indian Trade, as it is at present, must admit that it is restricted by the insufficient supply of silver, everything points in this direction. The high rate of discount demanded by banks, brought on no doubt in a great measure by the enhanced value of the rupee, is a serious drawback to commercial progress. We in Assam, who in past years had no difficulty whatever in securing our monthly cash requirements from the Marwaries, at a discount of 8 annas per cent., cannot now secure the amount required at even 12 annas and 1 rupee per cent., and we have to import rupees from Calcutta at great risk and heavy cost.

The amounts of spurious rupees in circulation in Assam will require the serious attention of Government, and we cannot help thinking that the recent discovery at Lahore of illicit coinage is only one instance of the enormous extent this profitable conversion of bullion into rupees is taken advantage of owing to the fictitious value of our coinage.

We would also point out, with exchange at 1*s.* 4*d.*, the great disadvantages we should have to deal with in competing with China and other countries where silver is taken at its intrinsic value.

Looking at trade generally, I may mention that in the report of the foreign trade of Calcutta for 1897, the

total trade returns with the United Kingdom show a falling off of 8 per cent. imports and exports, being rupees 411,745,761 in 1897–98, against 450,257,267 for the previous year.

There being such a number of conflicting interests at stake, we are cautious in making any suggestion as to a method to be adopted to bring about a successful issue to the much-vexed question of Indian currency, we may justly claim that our share in promoting one of the greatest industries in India has been a prominent one, and we would protest in the strongest terms against any artificial means being countenanced by the Government of India to further bolster up exchange; as such a course merely results in the extinction of the margin of profit to the Indian producer.

We, the Assam Branch of the Indian Tea Association, cordially support the resolutions come to by the General Committee of the Indian Tea Association, viz. :—

1. That a gold standard is not needed in India, even if it be practicable to establish it.

2. That the cost of establishing it (with or without a gold currency) is prohibitive and that an undue proportion of such cost will fall upon tea growers.

3. That in the opinion of this Branch, the Indian Currency Commission should be directed to inquire into the question of how to re-open the mints to the free coinage of silver, with the least inconvenience to the trade of this country.

I have, &c.,
J. Buckingham,
Chairman, Assam Branch, Indian Tea Association.

To
The Secretary, Government of India,
Finance and Commerce Department, Calcutta.

No. 9.

The Humble Petition of the Members of the Behar Indigo Planters' Association at present residing in the United Kingdom,

Humbly sheweth—

That your Petitioners, being of opinion that the proposals of the Government of India as set out in its Minute of the 3rd March 1898, will be found on trial to work detrimentally to the interests of your Petitioners, and of the general Indian community, your Petitioners would humbly pray that they be modified in such manner and to such extent as to allay the alarm now generally felt at the prospect of their adoption.

1. That any currency scheme which will affect the interests of the whole Indian community should be definite and concrete in its conception and automatic in its action; and any scheme in support of which the Government requires to write, "We always have it in "our power to carry the operation even further by "withdrawing a still larger quantity of silver and "replacing it in gold coin; and we recognise that "circumstances may arise in which such a measure "may be forced upon us" (para. 21 of Minute), cannot be such a one that recommends itself to your Petitioners.

2. That under the operation of the Currency Act of 1893 (added to other causes) the circulation of coin in India has become too restricted, and sufficient coin is not forthcoming to meet the requirements of the community.

3. That, under any scheme to be adopted to remedy the evils that at present admittedly exist, it is essential to the well-being of the community that it be supplied with sufficient coin to enable it to transact its trade and other business without unnecessary risk, and that the current coin to be used shall be such as it will accept and have confidence in.

4. That the curtailment of the currency by the destruction of existing coin will result in the serious enhancement of the existing rates of interest throughout the country; and, as a great portion of the trade of the country is carried on on credit or borrowed capital, will create alarm and entail serious loss, if not disastrous consequences, to all concerned.

5. That the declared intentions of the Government of India to appreciate the exchange value of the rupee will entail a heavy loss on all export producers, equal to from 6 per cent. to 7 per cent. for very penny it may be so appreciated.

6. That it is incumbent upon the Government to take such measures as will ensure a constant supply of standard coin, and to take such measures as may be necessary to maintain such coinage in a fair state of repair.

7. That the rupee coinage is the only coinage and standard of value adapted to the requirements of the major portion of the Indian community, and that will be accepted by it as money for many years to come. Your Petitioners would therefore humbly beg that the Indian Government be directed to recommence the coinage of the rupee in the Indian Mints, to meet the annual requirements of an expanding trade and a growing population.

8. That the coin to be so minted be minted on account of, and at the discretion of, the Government; and the profit likely to accrue from such mintage go in reduction of taxation.

9. That the figures relating to the currency of the country, as stated in the Minute, are admittedly only conjectured; your Petitioners would therefore submit that more definite and reliable information as to the amount of money in circulation and existing in the country be secured before the proposed measures receive the force of law.

10. That its proposed system will necessitate undue supervision or management, and any system that will necessitate constant supervision and management on the part of the Government must prejudicially affect the interests of some portion of the community, and create distrust of the Government motives and measures.

11. That the proposed measures of the Indian Government will not secure its ostensible object, viz., the creation of a stable rate of exchange between India and Europe, and the proposed destruction of coin will end in distrust of the action of Government, loss to the community in general, and waste of public funds.

12. That to secure a stable rate of exchange, under any scheme that may be devised, it is essential to such scheme that the Government place a limit on its ever-increasing demands on the international exchange market, and this the Government has omitted to do. A market in which bills to the extent of 10 millions sterling may be annually negotiated at 1*s.* 4*d.* per rupee may not be in a position to absorb such bills at such rate to the extent of 15 to 20 millions per annum.

13. That your Petitioners wholly disapprove of the Government proposal to create a gold standard of value without a gold currency, and of its proposed methods of appreciating the exchange value of the rupee.

14. That, while viewing with distrust all attempts to create an international gold standard of value without at the same time creating an international currency, your Petitioners would view with pleasure and confidence the introduction of any measures to create an international coinage.

15. That your Petitioners are of opinion that a stable rate of exchange between India and Europe can only be secured by a limit being put to the annual demands of the Indian Government on the exchange market, and by the adoption of the English sovereign and Indian rupee as the coins of the realm; by the sovereign being declared legal tender in India to a limited amount, and at a declared and equitable value in rupees, and by rupees being declared legal tender in England to the same extent or limit as silver is at present under the law of England.

16. Your Petitioners would, for the above reasons, humbly pray that the Indian Government proposals to destroy existing coin and further restrict the currency of the country be not proceeded with, and that any measures it may be deemed necessary to take to secure a stable rate of exchange may be such as to act automatically, and not wholly subjected to the influences or varying necessities of the Government.

Dated 28th October 1898.

W. B. Hudson.
J. M. Gibson.
For selves and Members of
Indigo Defence Association.

F. A. Shaw, Harlington Manor,
Toddington, Bedfordshire,
Honorary Secretary.

4th November 1898.

To the Right Honourable
Sir Henry H. Fowler, G.C.S.I., M.P.,
Chairman of the Committee on Indian Currency.

B.—*Official Documents.*

No. 10.

MEMORANDUM by Sir HENRY WATERFIELD, K.C.S.I., C.B., Financial Secretary to the India Office, relating to the SYSTEM of effecting REMITTANCES from INDIA.

The revenue of the Government of India is almost entirely received in India, in rupees, the sterling receipts in England not forming more than about $\frac{1}{300}$th of the total. But a large part of the expenditure, now amounting (including exchange) to about one-fourth of the whole, has to be defrayed in England in sterling, and it is necessary that the Government of India should make remittances to England to meet these expenses.

The sum which has to be added to the sterling payments, in order to express the number of tens of rupees which it costs to liquidate them, is called the charge for exchange.

Besides the expenditure charged on the revenue, there are other disbursements in England, such as the purchase of stores for public works of which the cost of construction is charged to capital, remittance transactions effected in this country in return for receipts in India, discharge of loans, &c., all of which, when not defrayed by borrowing in England, must be provided for by remittances from India.

The manner in which such remittances could be defrayed with the greatest advantage engaged the attention of the Court of Directors as long ago as 1813, when they explained to the Government of India that this might be effected either by advances to the public service, which would be repaid by the British Government in England, or by remittances through private merchants, who would pay money in England in return for bills on the Indian Government, or would receive advances in India from the Government, to be employed in the purchase of goods consigned to the United Kingdom; if these methods failed to give sufficient remittances, bullion might occasionally be consigned to the Court of Directors.

Writing again in 1829, the Court stated that, owing to the peace, the method of remitting through the British Government had ceased to be of much importance. Bills of exchange continued to be drawn on the Governments in India and the agents at Canton, but these had been found to give a less profitable rate of exchange than the recent bullion remittances; but, on principle, they were opposed to the abstraction of the precious metals from India. They seem, however, at that time to have thought advances on the hypothecation of goods the preferable course, though, if all other modes of remittances failed, it was inevitable that bullion should be sent.

At that time the amount required was upwards of 3,000,000*l.* a year; but it was estimated at about 2¾ millions in 1832, when a Select Committee of the House of Commons examined the question of the probable effect on such remittances which would be caused by discontinuing the union of the trade and the Government in India. The action taken by the Court was to revise the conditions on which advances repayable in England should in India be secured on consignments of merchandise.

The system under which money was at that time raised in London by bills on India, was by a notice that cash would be received at the Company's treasury, in exchange for bills for not less than 100*l.*, payable at 60 days' sight, and drawn upon the Governments in India, at the rate of exchange notified from time to time. The rates varied from 1*s.* 8¼*d.* to 2*s.* 2½*d.* between 1833 and 1857, the lowest rates being in 1833–34, 1845, and 1848, and the highest in 1855 and 1857.

Much objection was taken by the East India Associations and Chambers of Commerce, both in the United Kingdom and in India, to the system of making advances on consignments of produce, as introducing a vicious system of credit, and interfering with the ordinary course of trade; and in 1843 the Government of India publicly notified that they had recommended to the Court the discontinuance of the system. The East India Company, however, declined to accept the proposal, and the practice was continued for several years.

During the 13 years from 1834–35 to 1846–47, the remittances amounted to 26,755,192*l.* obtained by bills on India, and 12,791,670*l.* through advances on hypothecation of merchandise. The subject was investigated by a Select Committee of the House of Commons in 1848, and the representative of the East India Company said that, owing to the difficulty of selling bills, it had recently been necessary to resort to a remittance of bullion, and it was considered inexpedient to effect the remittances by any one mode, to the exclusion of all others. It was found necessary to effect remittances of silver bullion which realised 918,224*l.* in 1848–49, and 322,365*l.* in 1849–50.

Although the East India Company never formally resigned the right of obtaining supplies by advances on hypothecation, they tacitly abandoned the practice after 1850–51, as a new method of meeting their requirements presented itself. This was through the receipt of capital deposited in the home treasury by the companies, which about this time began to be formed for the construction of railways in India by means of funds supplied from the local treasuries. In 1854–55 a remittance of 412,022*l.* in gold was sent to England, and in the following year 7,202*l.*

On the outbreak of the Mutiny in 1857, it became necessary to raise the rate of exchange for bills on India to a prohibitory rate; in 1857–58 only 628,499*l.* was so obtained, and during the next three years only 31,392*l.*, while assistance had to be given to the Government of India by forwarding silver bullion* to them. In the five years from 1857–58 to 1861–62 the Home Debt was increased by nearly 30,000,000*l.*, and a net sum of about 20,000,000*l.* was received from the railway companies.

Towards the close of 1861 it was found practicable to resume the course of obtaining remittances from India; and the Government of India were asked whether they considered that this could most advantageously be effected by bills being drawn on them, by their purchasing bills in Calcutta, or by the adoption of both methods. They at first remitted 120,000*l.* by purchasing bills on London in favour of the Secretary of State; but, finding themselves unable to depend on a continued succession of such remittances, they requested that the further sum required might be obtained by means of bills on the Government of India. Instead, however, of announcing the readiness at any time to sell bills at a certain rate of exchange, it was decided to offer them on a particular day for a specified amount to the highest bidders.

Accordingly, on the 22nd of January 1862, an advertisement was issued announcing that tenders would be received at the Bank of England, on the 1st of February, of March, and of April, for bills of exchange, payable on demand, on the three Governments in India, for not more than 40 lakhs (Rs. 40,00,000) in each month. In order to obviate the necessity of shipping bullion from Calcutta to Madras or Bombay, it was stated that not more than 10 lakhs would be drawn on either of those places. Power was reserved to issue bills for less than the full amount offered, and to carry the difference to the next month. Tenders were to be for not less than Rs. 10,000, and a farthing per rupee to be the smallest fraction tendered. No bill would be issued for less than Rs. 5,000. If the tender were accepted, payment was to be made within a fortnight.

Various modifications of the terms have been since made. In March 1882, the fraction accepted was reduced to $\frac{1}{8}$th of a penny per rupee; in January 1875, to $\frac{1}{16}$th; and in November 1882, dealings at $\frac{1}{32}$nd of a penny were permitted. In November 1862 the sales were effected twice a month, and in August 1876 they began to be made on every Wednesday, payment being required on or before the following Tuesday. In October 1878 the right to carry forward unallotted amounts was abandoned.

In 1864 it was found unnecessary to prescribe a limit of the amount to be drawn on Madras; but, owing to the demands on the Bombay treasury caused by the Abyssinian Expedition, drawings on that Presidency were suspended from September 1867 to May 1870; and, in consequence of the drain on the treasuries through the war, drought, and other causes, from December 1868 to May 1869 no bills on India were issued.

Early in 1876 the rates of exchange at which tenders for bills were made were so low that for three fortnights none were accepted; but it was not found possible to presevere in that course, and on the 22nd of March 1876 permission was given to tender either for bills or for amounts payable immediately in India on telegraphic advice. In August 1876 it was announced that, besides the amount advertised for the fortnightly drawing, tenders would be received intermediately for a limited amount at a minimum rate of 1*s.* 8¼*d.* per rupee.

In 1877 drawings were again suspended for three months, owing to the famine in India; and, on their

* 8,165,392*l.* in the five years from 1857–58 to 1861–62.

resumption, bills only were granted. Telegraphic transfers were not resumed till early in 1882. In January 1880 the limit of allotment on Bombay was discontinued.

When the system of drawing bills on India was resumed in 1862, there was, owing to the American War, a great demand for cotton from India, and consequently for bills on that country. Down to November 1864, the rate of exchange realised varied from 2*s.* 0¼*d.* to 1*s.* 11⅛*d.*, but, when that demand fell off, lower rates had to be accepted, and bills were sold at 1*s.* 10¾*d.* in May 1865, and 1*s.* 10*d.* in July 1866; the last time that 2*s.* per rupee was realised was in April 1867. From November 1867 to July 1873 the rates varied between 1*s.* 11¾*d.* and 1*s.* 10½*d.*

About that time the requirements of the Home Treasury began to increase very materially owing to the progress of the Indian railways. In 1872-73 the withdrawals of capital by the companies for the first time exceeded their deposits; and the purchase in this country of stores for the construction of State railways added to the amount of sterling money required, while the fall in exchange yet further increased the amount of rupees needed for remittance. The average amount of bills drawn in the eight years from 1863–64 to 1869–70 was Rs. 6,33,71,000.

In 1870–71 the amount was			-	Rs.9,00,85,000
„ 1871–72	„	„	-	„ 10,70,00,000
„ 1872–73	„	„	-	„ 14,70,25,000

The restrictions on silver coinage by Germany and the Latin Union in 1871 to 1874, and the enormous production of the metal in the United States from 1874 onwards, depreciated silver very greatly, and the effect on the price of bills on India was soon apparent. After falling to 1*s.* 9⅝*d.* in December 1873, exchange suddenly rose in the following month to 1*s.* 11½*d.* and 1*s.* 11¼*d.*, owing to the rate of discount at Calcutta being from 9½ to 10½ per cent., but in August 1874 it fell to 1*s.* 9¾*d.* It varied between 1*s.* 10½*d.* and 1*s.* 9*d.* till February 1876, when the fall became much more rapid, and on the 5th of July 1876 telegraphic transfers were sold as low as 1*s.* 6½*d.* Then a reaction set in, and exchange rose to 1*s.* 10$\frac{9}{16}$*d.* for bills in December of that year. From May 1877 to April 1878, the rate was very steady at about 1*s.* 8¾*d.*; but it then began to fall, reaching 1*s.* 6⅝*d.* in January 1879, from which it rose again to 1*s.* 8⅝*d.* in June. There was then a period of fair steadiness, the rate varying between 1*s.* 8¾*d.* and 1*s.* 7⅞*d.* from June 1879 to December 1882.

In June 1881 the plan was adopted of announcing, two hours before the tenders for bills were opened, the minimum rate at which they would be accepted.

In March 1882 it was decided to sell bills, in addition to those allotted by public tender on Wednesday, at $\frac{1}{16}$th of a penny above the minimum rate of the public allotment, and telegraphic transfers at ⅛th above that rate; but in the following November these differences were reduced to $\frac{1}{32}$*d.* and $\frac{3}{32}$*d.* respectively, and it was announced that tenders for telegraphic transfers might be made at $\frac{1}{16}$*d.* above the minimum for bills.

In the autumn of 1882 an endeavour was made to support exchange, by refusing to accept tenders unless made at the minimum price at which the Secretary of State in Council considered it proper to sell bills; but, after persevering for about three months, it was found necessary to give way, and accept the highest tenders.

The question whether any other mode of effecting the remittances can be usefully adopted has been frequently considered. On a failure of the demand for bills in 1866, the Secretary of State directed the resumption of the plan of making advances on hypothecation of goods, and also gave orders to send gold, and, if necessary, silver, to England. In 1865–66 gold had been remitted, realising 159,858*l.*; and in 1866–67 a further amount of 221,634*l.* was obtained by the consignment of gold, and 660,668*l.* from silver. But, on the demand for bills reviving, such remittances were checked, and no action was taken in regard to the hypothecation of merchandise. The question o establishing an agency in China was about the same time considered; but it was deemed better to sell the bills on India, leaving the private remitters to China to make their own arrangements.

Mr. Seccombe, when examined by the Select Committee on East India Finance in 1881, regarding the mode of obtaining remittances, said that the practice of drawing bills on India had been found to be the best; they were so drawn "upon the principle that the Government "ought not to speculate at all upon the exchanges, "but to have some regular system, so as not to "interfere with the ordinary operations of Commerce, "in order that the mercantile community and the "public generally may carry on their affairs with a "knowledge of the operations of the Government." If the exchange fell so low as to make a bullion remittance more profitable, the subject of such a remittance was duly considered.

The question of making advances on hypothecation was again considered in 1876, but it was not thought desirable to adopt it. Nor could the Government of India suggest any better plan than that of selling the bills to bankers and others, who would perform the operation far better than would Government officers. Whatever the agency employed, the remittance must be effected by exports from India for the requirements of the Home Treasury, in excess of those needed for the settlement of the rest of the account between India and the external world, so that measures for increasing the exports would doubtless have a favourable effect on the remittances.

In 1877 it was considered whether advantage would be gained by the Government purchasing in Calcutta the drafts of the exchange banks on their London bankers at six months' sight; and in 1878 bills were bought in Calcutta to the extent of about a million and a half. But it was felt to be impracticable to carry into effect at the same time the two methods, while there were risks attendant on the purchase of the bills in India; and, therefore, it could only be viewed as a strictly temporary expedient.

In 1879 gold was purchased in India which realised in London an outturn of 486,947*l.* In the same year it was considered whether the Customs duties should be taken in gold, and whether the sales of opium should be effected on the basis of payments in London; but objection was felt to any such disturbance of the trade as might result from the proposed measures.

In March 1882 three members of the Finance Committee of the Council of India had a meeting in the room of the Governor of the Bank of England, with representatives of the eight exchange banks, and invited them to make any suggestions as to the mode of selling bills in the ensuing year. As the result of the conference, it was decided to continue the practice of announcing the minimum price for acceptance, and to post the amount sold up to that date; and to receive applications intermediately during the week for bills or transfers, at a rate not less than $\frac{1}{16}$th or ⅛th of a penny respectively above the published minimum.

At the end of 1882–83 the practice was once more considered, and the advertisement of the 28th of March 1883 issued, under which the bills and telegraphic transfers have been sold ever since, with very slight modification. Tenders are received each Wednesday at the Bank of England, and opened in the presence of representatives of the Council of India. The amount for which tenders will be received is announced beforehand, but not any minimum rate. Power is reserved to accept tenders for a smaller amount. Bills are granted for not less than Rs. 10,000, and $\frac{1}{32}$nd is the smallest fraction to be tendered. If tenders are equal in rate, and the amount available insufficient for all, a pro ratâ allotment is made. Applications for additional bills are received up to the following Tuesday; if the whole amount offered has been disposed of by public tender on the Wednesday, the additional bills will only be given at rates in excess of the minimum accepted. Applications may also be made for telegraphic transfers, which will in no case be granted for less than one lakh of rupees, both on Wednesdays, in addition to the advertised amount of bills, and on intermediate days.

In practice, it is usual to divide the advertised amount rateably between the tenders for bills and those for telegraphic transfers at a higher rate, the difference made between the two varying according to the circumstances of the time.

No. 11.

Letter from the Government of India forwarding Minute by Sir James Westland, respecting Government Balances, &c.

My Lord, Simla, the 20th October 1898.

We have the honour to forward for your Lordship's information a minute drawn up by the Honourable Sir James Westland on certain points referred to in the evidence given before the Committee of Enquiry into the Indian Currency. The minute is not meant to be a discussion of any matters under

reference to the Committee, but is merely directed to the elucidation of certain facts which do not appear to have been fully brought out in the evidence.

2. We request that, if your Lordship has no objection, the minute may be laid before the Committee.

We have the honour to be,
My Lord,
Your Lordship's most obedient,
humble Servants,

(Signed) Elgin.
" C. E. Nairne.
" J. Westland.
" M. D. Chalmers.
" E. H. H. Collen.
" A. C. Trevor.
" C. M. Rivaz.

To the Right Honourable
Lord George Francis Hamilton,
Her Majesty's Secretary of State for India.

Minute by the Honourable Sir James Westland, K.C.S.I.

Indian Currency Committee.

1. Having read the evidence given before the Committee of Enquiry into the Indian Currency, I desire to submit some observations with reference to it. I have, of course, no intention of entering into any arguments on the subject of the inquiry; that would be out of place; and my object is to elucidate some questions of fact referred to by witnesses, which, perhaps, the very familiarity of the subject to us in our daily administration prevented our bringing into sufficient relief. I allude especially to the position which the Government occupies in India as the holder of which it may be called the banking reserve of the country,—a fact perpetually present to our minds and largely guiding us in our operations, both with reference to the maintenance of our own balances and to the drawings of Council Bills, but which is not, I think, sufficiently realised by some of the gentlemen who have given evidence before the Committee.

2. The great difference between the position in this respect of the Treasury in England and that in India may be seen from the following figures. I show first those relating to England. (The figures are taken from the "Economist," and though they do not precisely correspond as to date, they are good enough for the present purpose):—

In Thousands of £.	Exchequer Balance in the Bank of England.	Cash Balance in the Bank of England.
End of December 1897 -	3,785	19,885
" January 1898 -	5,991	22,774
" February 1898 -	11,907	23,606
" March 1898 - -	9,918(*a*)	21,662
" April 1898 - -	5,286	22,720
" May 1898 - -	7,230	26,046
" June 1898 - -	4,800(*a*)	27,071

It will be seen from these figures that the Exchequer could at any time, if necessity arose, realize or spend the whole of the balance at its credit without causing the Bank of England to feel any but a temporary difficulty,—a difficulty which possibly might not be great enough to cause any steps of sufficient magnitude to affect, or even to come to the knowledge of, the public.

3. Now, take the figures for India. I have had them made up in the annexed tables A. and B. for each week of the quarter January to March 1898. It has to be remembered that according to the contract with the Presidency Banks the head "Public Deposits" in their weekly return is practically synonymous with balance at credit of Treasury; the balances of the High Courts and their officers, of railway companies, and some others which form a not inconsiderable aggregate of public money, lie outside these amounts, and are reckoned in India as private accounts. The average of the 13 weekly returns is:—

(Thousands of Rx.)	Balance at Credit of Government.	Cash Balance of the Bank.
Head Offices—		
Bank of Bengal - -	739	791
Bank of Bombay - -	527	636
Head Offices and Branches—		
Bank of Bengal - -	1,576	2,019
Bank of Madras - -	505	951
Bank of Bombay - -	873	953

It will be seen that a demand by Government for the use of its balances would leave the banks with an utterly insufficient amount of cash for their requirements—would in short deplete both the financial centres and the principal towns in the interior of nearly the whole of their banking balances.

4. In comparing England with India in this respect there are two features in the comparison which greatly aggravate the position as regards India. First, the balance in the Bank of England, large as it is, is after all only a portion of the available cash in London. The number of banks in London is legion, and even though the bulk of their available balances may be represented by a deposit account with the Bank of England, yet a large amount on the whole remains in their own possession; and the diminution of the balance in the Bank of England by the whole amount it holds at the credit of the Exchequer would be a small tax upon the whole banking balance of the place. In India this is not the case, the cash balance of the Presidency Banks is a much more important factor in Calcutta or Bombay, for the Exchange Banks hold a comparatively small balance in their own coffers, and even that is, I believe, sometimes an advance from the Presidency Bank. Secondly, the nexus between the Bank of England and the general available cash of the country is infinitely closer than that which exists in the case of the Indian Presidency Banks. The withdrawal of, say, five millions of Exchequer balance from the Bank of England for the purpose of meeting Government payments due throughout the country might deplete the available cash of the Bank of England for a week or two, but the amount would speedily flow back again through a thousand different channels, and the cash position of the bank would be as strong as ever. In India, on the other hand, payments of the kind do not flow back till after a considerable time, and partly do not come back at all. A war on the frontier, a famine in a province, or heavy expenditure upon railways will absorb large amounts of cash, part of which dribbles back slowly, and part of which for practical purposes never comes back at all.

5. These considerations introduce great difficulty into the management of the Government balances in India. It is not merely that we are obliged to have close regard to the demands that are coming upon us in respect of the payments due on Government account during the next few months, but that we are obliged to have regard to future commercial demand also. Just as the Directors of the Bank of England or of the Bank of Bengal, when they feel a strong commercial demand, would be false to their trust if they were merely to say "we have so many millions, or so many lakhs, in our "treasure chest, and there is, therefore, no use of our "interfering with the demand; let us go on giving "out money as long as we possess any"; so the Government in India is bound to carefully guard its balances against depletion brought about either by the payments which it has in due course to meet, or by too sudden withdrawal and disposal through the channels of commercial demand. The above-imagined policy on the part of the bank directors would inevitably bring about a crisis in a very short time, and carelessness of management of the same kind—a concession to immediate commercial demand, without having any regard to the future—would bring a crisis on the money market in India, much more severe and much more rapid by reason of the smallness, the almost non-existence, of any margin to fall back upon.

6. This position of responsibility is forced upon the Government in this country, not of its own will, but because it is accepted by the banking and the mercantile

(*a*) I cannot find the actuals; this figure is taken by deducting from the total Exchequer Balance one million, assumed to be the balance of the Bank of Ireland.

community as the monetary system of India. The whole commerce of the country is made to depend upon the Government balances; and the whole responsibility for the maintenance of an available cash reserve in India being thrown upon the Government, it is taken for granted that if there is a monetary stringency, it is due to the deliberate action of the Government. When bank directors, to meet the occasion I have been describing, put up the rate of discount, they are said to do what is wise and proper, both in their own interest and in those of the commercial public; when the Government, being in India in a similar position, takes similar measures, it is considered to be deliberately causing an undue stringency of the money market.

7. I cannot help noticing that it is almost assumed in the evidence given before the Committee that the Government of India, in their manipulation of Government balances and of Council Bills, systematically pursue this policy of creating for their own purposes a stringency of the kind described. I have more than once had occasion to give this theory explicit denial. Some important papers on the subject were published in the "Gazette of India" of February 23rd, 1889 (page 115, &c.), which were intended to show, and in my humble opinion did show, that our one endeavour in managing our balances was to make things as smooth for the money market as it was possible for them to be, consistently with a system under which the banks kept very little available money of their own. But explanations of the kind are readily forgotten in a place like India where everyone has his own business to attend to, and cares little to read and bear in mind official documents like those to which I refer. I may mention that within this last week I see it stated in the financial article of a widely circulated journal that "Govern-" ment has been busy reducing its balances with the " Bank of Bengal and the Bank of Bombay." I have not inquired into the facts, but I have no doubt that the real explanation is exactly what I gave in paragraphs 22 and 23 on page 124 of the above quotation, from the "Gazette," viz.:—that the so-called artificial reduction of Government balances at the banks is nothing more or less than the issue of the amount to the public in the form of Council Bills.

8. I may mention as regards the Government balances at the Presidency Banks that for the express purpose of preventing any manipulation of them either in the direction of stringency or of the opposite, we work them upon a purely mechanical system. A maximum and a minimum limit are fixed, both very much in excess of the minimum stipulated in the contract with the banks; and the rule is laid down that when the balance is above the maximum, the responsible account officer withdraws a certain amount into the reserve treasury; when it falls to or below the minimum he passes money into it from the reserve treasury. This rule is departed from only (1) when we are raising a loan, and, in order to let it fall easily on the market, allow the Presidency Banks to retain a nominally excessive Treasury balance (I call it nominal because the transaction is the result of a credit to Government on the bank's books by debit to advances on Government securities, and the bank for the moment does not really possess any funds available in cash against it); (2) when our general balance is so severely depleted that for the time we cannot spare funds from the district treasuries to maintain the usual standard of cash balance in the Presidency towns. There is, therefore, so far as the bank balance is concerned, no manipulation for the purpose of creating stringency of of affecting the rate of exchange.

9. I come now to the question of Council Bills. It seems almost a truism to say it, yet it seems necessary to call it to mind, that the amount of Council Bills that can be issued by the Secretary of State is strictly limited. I say this because it seems to me that the accusation of causing stringency is founded in some cases on the mere fact that the Secretary of State has not issued bills for the whole amount required for the payment of the balance of trade. The amount which it is possible to draw in a year may, for ordinary times, be reckoned thus:

	Rx.
Surplus of revenue in India over expenditure in India, including expenditure on capital account -	23,000,000
Money raised by loan in India for capital expenditure - -	3,000,000
Total available -	26,000,000

These figures vary of course from year to year, but it must be clear that whatever the figures are, they limit the amount for which the Secretary of State may draw.

10. Now, as pointed out at length in the papers of 1889 which I have already quoted, the minimum balance with which we can carry on the business of the Government in India is about eight crores: this eight crores includes the balances at our credit in the Presidency Banks and their branches. Our balances went down to that figure and below it in the end of the year 1896 and again in the end of 1897; that is to say, in both of these years the Secretary of State drew even more than was consistent with safety; he could not have drawn more for the simple reason that we had no funds wherewith to pay. So anxious were we to supply the money market with a full amount of Council Bills that in December 1896 we took special legislative measures to add to our cash balances two crores of rupees out of currency reserve, and thus enabled the Secretary of State to enhance his drawings by that amount. And again in January 1898 we passed a special law to enable the Secretary of State, if necessary, to draw Council Bills against our currency reserve. In the present year, 1898, our Council Bill programme was again based on the calculation that we should place at the Secretary of State's disposal, for drawings, everything we could spare subject to the condition of our having eight crores in our cash balances at the minimum period. (The exact figure—I have the estimates before me as I write—was 857 lakhs.) Our prospects as regards balances have been much improved by better revenue, and we communicated the fact to the Secretary of State in July and again in September for the express purpose of enabling him to enhance his drawings up to the limit of our capacity to meet them; and he enhanced them accordingly. Surely what I have stated affords the most ample evidence that our policy throughout is the very opposite of seeking to raise exchange by causing stringency. We have consistently done our best to place at the disposal of the market every surplus rupee we can spare.

11. The truth is that in India, where it is too much the habit to look to Government for everything, it seems not unnatural to expect the Government to finance not only the administration of the country, but its trade and commerce also. Accordingly, when commerce finds a deficiency of available funds, the cause of the deficiency is sought for not in the scarcity of banking capital, but in some action of the Government, which is expected, with resources that are often barely sufficient to meet the financial requirements of its own administration, to supply also all that is wanted for the movements of two hundred crores of imports and exports.

12. One difficulty which is alluded to in some parts of the evidence is that our revenue does not come in equally during the year. This is of course a necessity in a country where so much of the revenue is land revenue, and has to be collected at the time when the revenue payers can most easily afford to pay it—viz., the time of harvesting and disposing of their crops.

I find the following is a rough estimate of the distribution, through the year, of the 26 crores which as above mentioned, became available for drawings. I take the three crores of debt as received half in July and half in August.

	In thousands of Rx.
April - - - -	600
May - - - -	1,900
June - - - -	3,000
July - - - -	2,500
August - - -	1,300
September - - -	—
October - - -	300
November - - -	700
December - - -	2,500
January - - -	5,500
February - - -	3,100
March - - - -	4,600
Total - -	26,000

13. Now, if the Secretary of State could distribute his drawings after the above fashion (or rather take the figures a month later so as to allow the excesses of revenue to be brought down to the Presidency towns to meet his bills) the result would no doubt be that our

excess cash balances (that is, the surplus over what we require for treasuries that are not in charge of banks), would be wholly, or nearly so, at the disposal of commerce. But I must point out that this is more a theoretical possibility than a real one. As I have already explained, there are no funds for Government to fall back upon, if it surrenders to commercial uses its own cash balances and then suddenly finds that it must alter its programme of revenue and expenditure. There have been two crises of that kind within the last two years. The first was in October 1896 when the rains failed and prospects of famine suddenly made their appearance in India. We realised that the first and necessary step was to make large remissions of revenue at once; this came upon us just as our balances were descending to their minimum, and there was no remedy but to call upon the Secretary of State immediately to suspend his drawings, which were being as usual so regulated as to leave no margin in December. The second was in the outbreak of frontier warfare in August and September 1897, when again we were obliged to stop the Secretary of State's drawings in order that we might have money to expend on the necessary military operations.

14. It is not possible for us therefore, dependent as we are upon our own rescurces, to carry on the administration with our balance continually hovering about eight crores. We can afford the risk of letting it run down to eight crores in November and December when we know we shall be amply in funds again when the revenue comes in in January. But if we had to keep to one figure all the year round, we would not be safe under a minimum of 11 crores (that is to say, a continual margin, against possible sudden claims, of three crores). Thus the proper way of describing the policy under which we might place our margin of money at the disposal of commerce would be "Reckon Rx. 11,000,000 as your minimum current balance; but inasmuch as you can stand the risk of letting it run down, for a month or two, but not longer, to Rx. 8,000,000, give commerce the advantage for that month or two of the Rx. 3,000,000 you can thus spare."

15. This is really not very far different from what we actually do; at all events, the argument shows that the money we withhold from possible utilisation by commerce is only the excess which we hold over Rx. 11,000,000;* and that it is not possible, from a practical point of view for us to accept as a rule of working: "Eight crores is your necessary minimum, "and all that you hold in excess of that should be "regarded as available for commercial use." In short, eight crores is not a working minimum; it is a point of danger which we can tolerate if it is to last only for a month or two, but which might at any time land us in disaster, if we tried to work with it for a longer period.

16. The distribution of Council Bills over the twelve months remains entirely in the hands of the Secretary of State; we, in India, give him from time to time our recommendations, and especially advice as to the amount we can make available for his drawings; but as the primary object of the Council Bills is to place him in funds for the expenditure which he has to undertake, we leave it to him to consider when drawings may be eased off for want of commercial demand, or increased to meet commercial demand. At the same time we are quite aware that the policy of the Secretary of State in the matter is the same as our own, that is, to draw during the twelve months as much as we can meet. The considerations I have set out will show that the utmost the Secretary of State could do, if he were to neglect in regulating his drawings every consideration but that of momentary commercial convenience, would be that he might occasionally be a crore or two ahead of his drawings as he regulates them on the present system, at the risk of having to pull up after a month or two in order to allow our resources to come up to his demands upon them. I pronounce no opinion as to whether it is convenient for commerce to have a crore a week placed at its disposal in February to April, and then have it cut down to 12 or 15 lakhs a week in May. Of course nothing that the Secretary of State can do will increase the total of his drawings over the twelve months.

17. Having thus placed in the hands of the Secretary of State the regulation of the drawings of Council Bills, we naturally consider ourselves precluded from interfering with his operations by advancing money, even on interest, to the Presidency or other banks in India. Occasionally, but very rarely, short loans of the kind are made by us, but it is only for the relief of temporary difficulties. The last occasion on which a proposal of the kind was made to us is referred to in the evidence (Question 8362). In April last the Bank of Bombay, whose rate at the time was 13 per cent., asked us to advance 25 lakhs to it, for a short time, at 6 per cent. This we either formally declined, or were on the point of declining, when the proposal was altered into one to borrow from us at bank rate. Within three or four days, however, the stringency of money was relieved, the bank rate gave way, and we thought the necessity for any extraordinary measure had ceased.

18 Following this general, and as I have been trying to explain false, impression as to our policy in the management of Government Balances and Council Bills, I observe that the proposals of the Governmen of India made in the despatch of March 3rd have been described as a policy of forcing gold into the country by means of an artificial stringency in the money market. I do not enter upon any argument as to whether that will be their effect--that is a question of opinion on which it is for the Committee to pronounce; but that such is their deliberate intention I may be allowed to deny. The stringency unfortunately is there. I enter upon no argument as to whether it is due to the closing of the mints, or to the withdrawal of capital from India, which began long before the Mints were closed, or whether it is caused partly by the one and partly by the other. But I think I have made it clear that, granting the situation brought about by the currency policy of 1893, the stringency has occurred, not by reason of any action taken by Government, but in spite of all the efforts made by Government to prevent it. The policy we set out in our despatch of 3rd March was a policy which had for its object not to increase it, but to relieve it, and I may represent the argument in this way: "The "stringency will not be relieved until capital is sent "out to India. Holders of capital are afraid to send "it out as long as the currency is on a silver basis, "and is in such an amount that a turn of the scale, "whether by cessation of activity in trade or in any "other way, will send down the rate of exchange. "Let us get over this transition stage; let us get to "a state of things where, instead of the circulation "being composed of 120 crores of silver, it is composed "of, say, 105 crores of silver and 15 crores of gold "(that is, 10 million pounds). Capitalists will now see "that the money in circulation in the country must "be reduced from 120 crores (that is 105 in silver and "15 in gold) to 105 crores before exchange falls below "16 pence; and this state of things will give them "confidence enough to send out their money to thus "relieve the stringency."—This is what is set out in paragraph 22 of the despatch. The argument may be right or wrong; on that point I in this place urge nothing; but the intention I think is sufficiently clear; and it was not an intention to operate through artificial stringency.

19. This explanation will also account for the position given in our proposals to the melting of rupees. While the rupees are still in existence (as they were after the stoppage of drawings in 1893-94) the confidence we hoped to create could not exist. The capitalist would argue: "These rupees, though now withdrawn, may "at any time come back into circulation, and I cannot "accept it as certain that the rupee circulation will "not exceed 105 crores; while therefore this possibility "lasts, I hold my hand.

20. One more explanation on this subject and I have done. The Government never had it in their minds to withdraw rupees from the active circulation by any new operation of withdrawal or recall. Under the monetary system of India which I have explained, rupees are every year withdrawn from circulation in the payment of revenue, especially in the months of January to March, and they are returned to it again through the operation of Council drawings. In such a monetary system, the restriction of Council Bills and the withdrawal of silver coin are synonymous terms; the Government can get possession of silver coin for the purpose of melting down, only by the Secretary of State drawing a smaller amount of Council Bills than he otherwise would draw. Our notion was that in this way the reduction of rupee circulation would commence to be brought into effect, that the Secretary of State

* For example, I find that from October 1896 to December 1897 there were only two months in which the cash balance was over Rx. 12,000,000,

would refuse to draw under some rate settled from time to time, but at least advancing towards 16 pence, and that the amount he thus withheld would be by us permanently withdrawn from circulation, and melted down so as not to be in any way further available in the form of silver currency. How far this operation would have to be carried before exchange was for the time fixed at 16 pence would be matter of experience (paragraph 16 of despatch). We would have to carry it not only far enough to raise the exchange value to 16 pence for the time, but still further with the aid of our currency reserve (paragraph 20) so as to have a margin to fall back upon, namely, to ensure that the reduction of silver currency would be enough to maintain the 16 pence value, even if trade were to become more inactive than at the beginning. Meantime we hoped that with this declared policy before us commerce would find, in the prospect of the rise of the rupee towards 16 pence and its fixation at that point, sufficient encouragement to send out gold coin for its own needs, just as before 1893 it used to send out silver to the mints when the supply of Council Bills fell short of its requirements.

21. Again, I repeat, it will be understood that I am not here engaged in defending the plan; I am merely explaining the proposals with reference to certain portions of the evidence laid before the Committee. Things have advanced even since the proposals were laid before the Secretary of State; the rupee has maintained itself very near to 16 pence even during the inactive period of the year; and the redundancy of the circulation with reference to that value—that is, the amount which the Government of India proposed to withdraw from any possible return into circulation—appears now to be less than it appeared in March last.

22. I desire to add some remarks with reference to the allegations about illicit coinage which appear in some portions of the evidence given. We have been making continual inquiries regarding this; but we have not been able to discover that illicit coinage is in any respect more rife than it was before the rupee rose so much above its bullion value. Illicit coinage still goes on in India as everywhere else, but obviously the only kind of illicit coinage that can arise in connexion with the closure of the mints is illicit coinage of standard silver; and discoveries of coinage of base metal have nothing to do with the present subject. What we have ascertained is that the public have had their attention drawn to the subject, and that they are apt, much more than they were before, to suspect rupees which turn out upon examination to be perfectly good. We have arranged for more systematic inquiry, and all I can say at present is that little evidence exists of any greater frequency than formerly of illicit coinage.

23. The coinage of Farrukhabad rupees, alluded to by more than one of the witnesses, has nothing to do with the question of illicit coinage of Government rupees. These are rupees of an ancient currency which bear inscriptions in Persian characters only. I do not believe that a single such rupee is anywhere used as coin in British India, and it is certain that not even the most simple individual could ever mistake one for a Government rupee. They are largely used as ornaments, and have been largely manufactured for that purpose. They also could no doubt be easily introduced into circulation as money in Native States, where the currency is often in such a condition that almost any bit of silver, bearing a Persian inscription or a part of one, passes from hand to hand rather in barter than as money. The officials of the Gwalior State the other day gave me a list of 16 different kinds of coin of this description which so passed, at various values, in the State of Gwalior alone.

24. We recently determined that this kind of manufacture was dangerous, both because it might interfere with the current coin of Native States, and still more because it might familiarise the people with the notion that coinage was an admissible form of private industry, and we altered the law so as to make it what the law probably always intended it to be, a criminal offence. The recent case was the first in which the change of the law was brought home to the people engaged in this trade; but it obviously indicates no danger of illicit coinage as regards Government rupees.

J. WESTLAND.

No. 12.

Note of 15th May 1872 *by* SIR RICHARD TEMPLE, G.C.S.I., *handed in by the* EARL OF NORTHBROOK (see *Q. No.* 8447).

I desire to lay before the Government of India three notes by Mr. G. Dickson, Secretary to Bank of Bengal, on the subject of the gold currency, which he was good enough to draw up at my request; also notes by Mr. R. B. Chapman, the Financial Secretary, and Mr. H. D. Sandeman, Officiating Comptroller General, and Mr. E. Gay, Deputy Comptroller General, on the same subject.

2. I have long believed that a gold currency is wanted in India; that its introduction ought to be an object for gradual, if not immediate, attainment; and that the British Government ought to adopt measures from time to time towards that end. I do not say the introduction of a gold coinage, for we have that already in India. We have gold pieces representing fifteen, ten, and five rupees respectively; and believed to represent these several sums very correctly, as regards the relative value of gold and silver. That this relative value has by these gold pieces been preserved with as much accuracy as possible under the circumstances was affirmed by the report of the Indian Currency Commissioners in 1867. But, despite their intrinsic merits, these coins are not and cannot be available as currency, because they are not legal tender. I conceive that we should, so far as we fairly can, permit inducements to arise for the importation of gold into India, and for its retention in considerable quantities in the country; that whenever such quantity might be found adequate, we should take the first opportunity to declare the gold coins legal tender to unlimited amount; that the gold pieces should continue to bear the fixed relation to the rupee; that for a time it might be necessary to permit the rupee to remain legal tender to an unlimited amount, which would involve temporarily the difficulty of double standard; that the transition period of double standard should be as short as possible, silver being reduced to a token coinage, and being legal tender up to a small amount only; and that gold should be ultimately the one legal standard.

3. Remembering that many steps must be taken before any such consummation could be arrived at, I should have preferred, just now, to confine myself to such practical measures as could be adopted at present. But, among the many doubts which surround the subject, I see, or imagine that I see, one doubt which affects the very root of the matter. It seems to be doubted whether a gold currency is needed at all for India, or whether it constitutes a requirement of that pressing or important character which would justify any alteration in so delicate an affair as the currency.

4. I do not at all share such doubt. On the contrary, I share the conviction expressed by my predecessors Mr. S. Laing and Sir C. Trevelyan and Mr. Massey, to the effect that a gold currency is among the urgent wants of India. With the exception of Mr. Wilson, every Financial Member of the Government of India has advocated this view. In 1866 similar views were advocated by a special Commission in India appointed to examine the whole subject, and have been maintained at one time or other by every chamber of commerce in India. But in the event of such doubt as above described being seriously entertained, I will attempt to briefly recapitulate the reasons why a gold currency is desirable in India. And my excuse for making the attempt must be this. If people shall strongly entertain an *a priori* conviction that a gold currency is really wanted, then they will find that the supposed difficulties in the way of its introduction are not at all insuperable. If, on the other hand, they have no such conviction, then the difficulties, which more or less beset every question of currency, become magnified to undue proportions.

5. It can hardly be necessary to recall to mind the superiority of gold over silver, or the reasons why in all countries the estimation of gold is about fifteen times greater than that of silver. A well-known writer on bullion has summarised the advantages of gold thus:—

"Gold is the noblest of all metals—the *king of the* " *metals*, as the alchemists of old used to call it. It " holds this exalted rank by virtue of its precious " physical and chemical properties, among which may " be mentioned, more especially, its indestructibility; " its signal power of resisting oxidising influences; its " fusibility; its permanent ductility and malleability; " its beautiful colour and splendid lustre."—*Seyd*— " Bullion and Foreign Exchanges."

6. It is this superior estimation which, causing gold to be so much more relatively portable than any other precious metal, gives it a practical efficiency in commercial transactions, of which inherent quality nothing save artificial restraints, from systems of currency, can deprive it.

7. The most advanced nations, England, France, Italy, America, Germany, Holland, possess a gold currency. Most of them have at various times adopted measures to change the currency of silver to gold. Some of them have even put forth efforts and undergone sacrifices for this object.

8. It is generally acknowledged by the best authorities that the money which is to be the medium of exchange and the measure of value in large transactions, or in all save small transactions, should be gold, as being the metal most suited for such purposes from its greatly superior estimation. Silver is suited only for trans-

actions too small for the use of gold; just as copper is suited only for transactions too small for the use of silver.

9. In the first place Adam Smith explains that—"In the progress of industry commercial nations have "found it convenient to coin several different metals "into money; gold for larger payments, silver for "purchases of moderate value, and copper or some "other coarse metal for those of still smaller "consideration."

10. Michel Chevalier gives a similar explanation:—"We know that for many centuries copper con-"stituted the money of Rome. Afterwards, society "having become richer, copper money was no longer "sufficient; with the increase of wealth, payments "became too cumbrous, and a more valuable metal "than copper was found better adapted for the bulk "of transactions; it was thus that silver money came "into use. This was soon after followed at Rome, "and for the same reason, by a gold currency. The "history of the currency in the monarchies which "were reared upon the ruins of the Roman Empire "reveals the same process." The same authority goes on to say of gold and silver—"a division of their "employment seems to be indicated; for silver the "smaller, for gold the larger, payments."

11. M'Culloch, speaking of gold and silver, says that "the former would be sure to be preferred as money "to the latter in all but petty transactions."

* * *

"The use of gold as money is accompanied by so "many advantages that it would maintain its place "even though it were somewhat underrated as com-"pared with silver. Inasmuch, however, as gold has "so many natural grounds of preference on its side, "the true plan is to make it the only standard."

12. Tooke, after rejecting *seriatim* the arguments for a change from a gold to a silver standard, says that "in "other respects it would be the substitution of the less "convenient for the most convenient description of "currency."

13. Chambers writes in his chapter on money—"A "substance has been employed as the chief circulating "medium over the civilized world. Its own nature "has made it the standard currency, though it is "relieved and aided by other kinds of currency. "This substance is gold, which by common consent "people at the utmost extremities of the civilised "world have used as their standard currency."

14. One of the main reasons for the preference of gold over silver is forcibly expressed by another writer (Dunning Macleod): "The greater the intrinsic value "of the metal, the better is it qualified to perform the "functions of a currency." * * * * "The more "rare and valuable the metal, the more portable and "convenient would it be, so that a man might carry "about with him, as it were, a concentrated essence of "power of commanding services." As John Stuart Mill observes:—

"There is an obvious convenience in making use of "the more costly metal for larger payments, and the "cheaper one for smaller; and the only question "relates to the mode in which this can best be done."

15. Even some of those authorities, for example, Ricardo and James Wilson, who prefer silver as the sole standard, make important admissions in favour of gold. Ricardo states that—"In favour of gold it may "be said that its greater value under a smaller bulk "eminently qualifies it for the standard in an opulent "country."

James Wilson says—"No one will be inclined to "deny that, if we had to begin a system of currency "*de novo*, the most convenient of all the various "systems now in practice would be found to be that "used in England, where gold is the standard, and "silver tokens of limited tender the subordinate "coins."

16. Now, these considerations of political economy are just as applicable to India as to any other civilised country. It will hardly be denied that India *is* a civilized country. Although civilization in a politico-economic sense is not so diffused in India as in Europe; though the mass of the people are less civilized than the corresponding classes of an European people, still India has a fair proportion of civilisation, has a large field for the exercise of political economy; all which, though inconsiderable relative to the vastness of the country, is considerable absolutely. Though on the whole a poor country, certainly, still India is in parts rich enough, has within particular limits great wealth, has extensive transactions, has in some respects much to do with money on a great scale.

17. It is no sufficient answer to this to say that the mass of the people never see anything better than copper money; that it is only certain classes that see even silver; and that but a comparatively limited number would see a gold currency if it existed. For the limited number who would see gold represent the most important classes of the country, just those classes whose skill, enterprise, and intelligence go far to make the fortune of the nation. If the sections of the people who would use gold were summed up, they would be found to represent a great and growing interest. And if they really require a gold currency, that would be a strong reason for introducing it.

18. Again, if it be supposed that such currency were not so urgently wanted for the interior of the country generally, still the question would remain as to whether it is wanted for the larger transactions of the inland trade and especially for the foreign trade. It is not so easy to gauge the inland or inter-portal trade. But we know the extent of the foreign trade exactly, and we can see what a mighty interest that represents.

19. But the number of persons in all India who would use a gold currency is not so limited as seems to be supposed. It may be mentally measured in this way. With our five-rupee gold piece legal tender, everyone who had to pay five rupees or more in metallic currency (unless he paid in currency notes) would pay in gold. Everyone who kept or hoarded five rupees and upwards in treasure would use gold. Let us compute by our own notions (we cannot ascertain exactly) what the number must be of payments of five rupees and upwards in all India within any year. Surely it must be very great. Quite great enough to justify the consideration of measures for introducing a gold currency.

20. Or let us suppose that, following the example of the five-franc gold coinage, or, forming the easily conceivable notion of a five-shilling gold piece, we were to have gold coins of lesser denomination than five rupees (for which the authority of M'Culloch might be cited)—say, for example, that we were to have $2\frac{1}{2}$-rupee gold pieces. Then every payment of metallic currency of $2\frac{1}{2}$ rupees and upwards would be made in gold, if there were a gold currency.

21. How very great, then, must the number be of such payments in a year.

22. But in these, as in other matters, there is such a thing as national prejudice. It is conceivable that such a population as the Indian might have some national prejudice against gold. But have they, in fact, any such prejudice against gold pieces? No, they have not. Quite the contrary; their prejudice, if they have any, is entirely in favour of gold. The imperial dynasties which preceded us in India had a gold currency. Some comparatively ancient gold coins have still a limited circulation, and enjoy the highest repute. It is remarkable that the gold coins which issue from the British Mints in India mostly find their way to Native States. It may be said, in general terms, that on our accession to power in India we found a gold currency existing conjointly with the silver currency. And it was reserved for us to accord silver the dominant and exclusive position which it now holds in the currency. My own belief is, that few nations have in their own minds a higher appreciation of gold than the Natives of India.

23. It was in 1835 that silver was made the sole legal tender in India. Gold, however, ceasing to be a legal tender, was still receivable at the Treasuries in payment of Government dues. Even this was stopped in 1853. The prohibition was withdrawn in 1869, since which time the gold pieces have been and are receivable at the Treasury as before.

24. This measure, however sound in principle, has not proved efficacious. Indeed the state of the exchanges prevailing since that time, has not been such as to cause the importation of gold bullion. And indeed nothing can bring about a permanent influx of gold, while gold pieces are not legal tender.

25. Upon this point M'Culloch writes thus:—"Silver has become in India, in fact as well as in "law, the sole legal tender * * * there are at the "same time various circumstances which make it "much to be regretted that an attempt should have "been made to exclude gold from the currency of "India; * * * had gold been allowed to circulate "as coin, it would have been extensively employed in "making large payments, and it would also have been "extensively hoarded. * * * It would be good "policy to reintroduce a gold currency."

26. M'Culloch further makes a remark which I shall cite in this place. After explaining that gold would, if it had a fair chance, circulate in India as well as silver, he goes on to say—"In that case the increased "demand for gold * * * would, by lessening the "demand for silver, have checked any tendency it "may have had to rise." Sir William Mansfield (now Lord Sandhurst) elaborated this same point in 1864. He estimated that the exclusion of gold from the currency caused a rise of 5 per cent. in the price of silver, and held that this led to injustice towards the landholding classes of India, who pay land revenue fixed for long periods or in perpetuity.

27. Whether we go to the full length of these conclusions or not, still we can hardly doubt that to virtually oblige the people of India (as we indeed do oblige them by our present system) to use only one precious metal for currency, when they might have had two precious metals, is to enhance the price of that one precious metal, silver, and thereby to put them to considerable expense unnecessarily. They must have the silver for currency use, and they must purchase it with their produce. If the price be enhanced, say, by even a small percentage, then let the significance of that be considered. The amount of silver in circulation cannot, of course, be stated, but it must evidently be very great; supposed to be at least 100 millions sterling in value, sometimes even estimated at 150 millions. The amount, whatever it may be, has been purchased by the people of India. Then, even a small percentage on either sum would give an extra expense of several millions, to which the people have been unnecessarily put. Such an estimate is not precise indeed, but it may serve to give some idea of the possible loss occasioned to India.

28. Again, to use gold instead of silver coins is to effect a great saving in minting charges and in wear and tear; or, per contra, to oblige the people to use silver coins when they might use gold is to put them to the expense of about fifteen times as much minting and wear and tear of coinage as might otherwise have been necessary. This cost may be relatively small, from 1 to 2 per cent. on value of coins; still let us remember the amount of silver coined in India since 1835, about 197 millions, and we shall see that even a small percentage on this vast sum would be an appreciable amount. It follows that this amount might have been to a large extent saved to the country had there been a gold currency. Sir W. Mansfield summarises the advantages of gold as—

"1st, superior portability;"
"2nd, decrease of wastage;"
"3rd, economy in mintage;"

and he describes these as "elements of cheapness "which have a marked effect in asserting the superiority "of gold."

29. It is often said, in effect, that the certainty of silver always being largely employed as currency in a comparatively poor country like India is a reason why a gold currency is not wanted. But I contend, on the contrary, that this very circumstance is one of the reasons why a gold currency *is* wanted, because it tends to steady the price of that silver which is one of the necessaries of the national life.

30. On the whole, it seems clear that, while in all other branches and departments of administration we endeavour to give to India the best of everything, so far as we can, yet in respect of metallic currency we deliberately withhold from her the first-rate article and afford her a second-rate one.

31. The foregoing considerations apply to India in common with other countries where there may be commerce and accumulated wealth. But there are special reasons in India why a silver currency without any gold currency must be inconvenient. In other words, there are, in addition to the general reasons, special reasons why India ought to have a gold currency.

32. The continent of Europe, and especially the United Kingdom, obtain both gold and silver from about the same distance in the case of each metal. Those countries have commercial relations with gold and silver-producing regions. Gold comes direct from America, so does silver.

33. With India the case is different. She has but slight commercial relations with America. And consequently she has to obtain silver through the medium of England. This is to some extent a disadvantage, and must involve various charges, direct and indirect. She has also to obtain the silver, in which her currency solely consists, from an immense distance.

34. On the other hand, she could obtain gold from Australia direct, without employing any other country as a medium, and from a much shorter distance. Thus it would appear that from its situation Australia, with its gold-producing regions, is the natural source of supply of the precious metal to India. It is the present system of the metallic currency that prevents India from availing herself of the great natural advantage offered by Australia in this respect, and forces her to obtain her specie under comparatively disadvantageous circumstances.

35. As Colonel Smith, the Mint Master, has well expressed it:—

"The advantages of introducing gold into the "currency of our vast dependency need not be here "insisted upon. They may be inferred from the "unanimous wish of the inhabitants for a less cum-"brous means of exchange, from the benefit to be "derived by the whole civilized world from India's "taking her share of the increased produce of the gold "mines, and from the anomalous spectacle exhibited "for many years past, of ships freighted with gold "traversing half the globe in one direction, crossing "ships conveying an equal value of silver in the "opposite direction, for the adjustment of balances of "trade capable of settlement without either voyage, "and with a saving of expense of a quarter of a million "sterling annually."

36. Sir William Mansfield (now Lord Sandhurst) put the case thus:—

"There can be no good reason to compel the precious "metals to make the journey from Australia round by "London to India, instead of coming direct to the "latter country. Yet that is what to a certain extent "necessarily takes place, and which throws heavy "charges on the metal ordained as a legal tender, viz., "silver. The gold of Australia must go to London to "be exchanged for silver, which is then sent out to "India, after being bought at an artificially high "price in Europe and the United States. The "European markets are the middlemen, who obtain "their profits on the silver sent to India to restore the "balance of trade."

37. Sir Charles Trevelyan ably set forth the same point thus:—

"England has a southern as well as an eastern "empire, and the great staple of that southern empire "is gold. Owing to the exclusion of gold from the "Indian currency, the trade with Australia is chiefly "carried on in this way. The gold of Australia is "sent to England, where it is employed in buying "silver, and the silver is sent to India burdened with "the charges of the double voyage, and with the "additional interest accrued during the long period "occupied by it. The cotton and other exports of "India are charged with the extra expense arising "from this circuitous mode of payment. Even a "worse result is, that the trade cannot be carried on "in a regular manner. The gold remains in the Bank "of England until the Indian demand sets in, and then "it is suddenly withdrawn to sweep the continent of "silver for transmission to India."

38. The fact that the trade between India and Australia is not great, and is not likely to grow essentially, would not, of course, constitute a difficulty. It is true that if India received a large amount of gold from Australia she would not be able to send her produce to Australia in return. But the balance in favour of Australia would be settled and adjusted in the trade between India and England and England and Australia. India has extensive claims upon England for produce exported thither. She would transfer to Australia a portion of those claims, and thus pay for the gold.

39. The adjustments which take place in China will afford an illustration. China owes India yearly a large sum for opium. She does not wholly pay this debt by produce or treasure. She pays in part by transferring to India her claims upon England for Chinese produce exported thither.

40. But, further, there is one marked peculiarity in the situation of India—which is perhaps almost unique in the world—in that she has annually to remit to England money to the sum of many millions. The liability is as serious as it is inevitable, and the cost of so vast a remittance amounts to nearly half a million pounds annually, and sometimes more.

41. While the Indian currency is in silver only, the principal means of remittance must be silver. Under these circumstances, India will never possess gold in adequate quantities. The balance due to her on trade

will be paid in silver; in the main, she must take that metal and none other. And she will possess no other precious metal wherewith to pay whatever there is to be paid by her in specie. She will have, then, only her silver and her produce wherewith to discharge her obligations.

42. But as England has a gold currency, the payments must be made in that metal, so far as they have to be made in money at all. And as India has to pay in gold, she must obtain gold either by means of her silver or her produce. This is the real basis of the transaction, though in practice India does not generally make her payments in specie. She receives gold in England from purchasers of bills called Council drafts, and pays to the holders of these drafts silver from the Indian Treasuries. But the payments are settled and adjusted in gold, and the difference chargeable to her on this adjustment comes to the same thing as if she had purchased with silver, or produce, the gold wherewith to make payment.

43. This arrangement appears to be inconvenient to India in various ways.

44. In the first place, she obtains her silver through England. The cost of effecting this is considerable. Then she has virtually to bear the charge of exchanging silver in her own limits for gold in England, and the cost of that, again, is considerable. It would be more economical, and more convenient, if she herself possessed the gold in which the payments had to be made. If her currency were to be gold, then she would always possess quantities of the very metal in which her obligations have to be discharged and her account adjusted.

45. If the currency of England had been silver, then the argument would be somewhat altered. At present India has a sort of double difficulty. Firstly, she has to make this great payment annually, in itself a difficulty. Then she has the additional difficulty of purchasing the metal in which the payment is calculated. This additional burden is caused by the present state of the currency. And this must aggravate the charges to which India is subject.

46. Again, under the existing status, the relative value of silver to gold is the regulator in all respects of the cost of these transactions to India. The value of silver is, of course, liable to fluctuations. For the value of gold in England being determined by law, and that of silver being not so determined, these fluctuations as regards silver are appreciably great, and are sometimes embarrassing by reason of the trouble and expense which they cause. Within India the value of silver is indeed determined by law, but that fact is of no use nor validity in respect to the exchange with England. Now, this difficulty would be mitigated, perhaps almost removed, if India had also a gold currency, with the same status as that of England, that is, with the value determined by law.

47. Mr. Goschen, in his work on Foreign Exchanges, writes:—

"Considering the case between silver and gold. "When a bill on Hamburg payable in silver is bought "in London for a certain price, payable in sovereigns, "what will determine the value? * * * * Gold "is simply merchandise in such countries as have a "silver currency, and silver is merchandise in such "countries as have a gold standard; and according to "the price of the merchandise at a given moment, so "will the exchanges fluctuate. When a bill on "Hamburg is to be sold in London, all the previous "elements of value will have to be taken into considera-"tion; the rate of interest in the two countries, the "state of credit, relative indebtedness, and so forth, "but the value of silver in England will enter largely "into consideration, or, in the opposite case, the value "of gold in Hamburg."

Now, it seems to me that, *mutato nomine*, the same story might be told of the exchange between England and her Indian dependencies, and that the process inevitably places India at a disadvantage.

48. Thus I contend that there should be one standard only of value for the two countries; in other words, that the standard for India should be the same as that for England; that India is specially entitled to this advantage because she is more conveniently situated as respects the gold-producing regions than the silver-producing regions, and because gold is the currency of the country to which India has to make such great payments; and that a gold currency would not only cause a saving to India in the procuring of so important an article as specie, but would also lessen the difficulties arising from the pecuniary obligations of India towards England.

49. There is one more point to be noticed, which is this: it is observed by the Financial Secretary, Mr. R. B. Chapman, that when, upon the establishment of a gold standard, silver came to be demonetised, and the intrinsic value of the rupee to be diminished, the effect on the native mind would be bad. Mr. Chapman's words are: "It follows that we shall have to "substitute for the use of the masses of our popu-"lation a token silver currency for the present "full value currency. Are we at all certain what "the effect of this will be upon the ignorant popu-"lation, or how a silver token currency will work "alongside of a full value Native State silver "currency?"

50. It is quite true that the natives will always look to the intrinsic as well as to the nominal value of the rupee. Though the new rupee, with a less intrinsic value of, say, 6 per cent., may pass in currency for the same value as the old rupee, still the natives will not estimate it so highly as the old rupee, because they use rupees for melting and for hoarding as well as for currency. All this may be admitted to the full. But what then? I fail to perceive what evil would follow. It is said that the natives would prefer the rupees of Native States, in which the proportion of alloy might be less than in the demonetised British rupee. It might not be of much consequence if this were to be the case. But it by no means follows that any such consequence would arise. If natives closely estimate the grains of fine silver in the rupee, they will weigh accurately the British rupee against the Native rupee. And the British rupee will be valued at its weight in fine silver, at least. Besides this, it would have the advantage of being legal tender in British territory for small amounts, which the Native rupee would not. And this advantage must secure the preference to the British over the Native rupee, as silver to silver.

51. It might be said, of course, that the British rupee would cease to possess the estimation it now possesses, and this portion of our currency would decline in reputation. Very true, no doubt. But, on the other hand, we should have given the country a gold currency the coins of which would rise rapidly to the highest repute, and to a degree of estimation to which even our silver has never yet risen. I believe that no coins that ever were coined in this country would be so popular as the gold legal tender coinage of the British Government. In other words, while we deprive the people of the old silver standard, we give them in return a superior gold standard. And thus the last state of the currency would be far better than the first.

52.* Further, it is sometimes urged, as a reason against introducing a gold currency, that there is

never likely to be a sufficient quantity of gold available to justify its being declared legal tender. The quantity of specie required for circulation in India was estimated, 15 years since, at 150 millions sterling, or rather, that was the supposed value of the silver coins in circulation. Within this century the net importation of gold has exceeded 99 millions, but only a small portion of it has been coined. Having regard to the long period that coin lasts, the coinage may now be estimated at more than 150 millions sterling, and the amount of gold bullion and specie in India is within this amount. These several quantities may not indeed be precisely known. But it is quite true that the amount of gold available or obtainable in India under present circumstances is very small, as compared with silver, and is not as yet nearly enough for what the requirements of the country would be after gold being declared legal tender. But though I admit all this to the full as fact, I do not at all admit it as a reason for refraining to declare gold to be legal tender. For, manifestly, the gold, having been once declared to be legal tender, would become one of the needs of the national existence. Gold would be an article which the country must purchase; and with its large surplus of exported produce over imported goods, and with an ample balance of trade in its favour, the country would have no difficulty in purchasing gold, which metal it could, as has been seen already, obtain direct from Australia on reasonable, perhaps even on favourable, terms. If, then, the need of gold for currency in India were to be anticipated, its influx into the country would be a matter of a few months, perhaps only of a few weeks, and the want would hardly have begun to be felt before it was supplied.

Before concluding, I would add that experience does not shake my belief that the relative value of gold and silver is represented according to scientific theory and principle by the present gold coinage of India, that is, 120 grains gold piece to 10 rupees; that the present rate offered by the Government of India in 1869 for the English and Australian sovereign, 10¼ rupees (ten rupees and four annas), coincides as nearly as possible with that standard; and that the conclusions arrived at by the Currency Commission in 1867 are sound. It is true that very few sovereigns have been received in the Treasuries since 1869, but this circumstance is attributable, not to any defect in the rating (10¼ rupees to the sovereign), but to the state of the exchanges, which have precluded the importation of gold bullion, silver being sole legal tender. How can gold compete with silver in India, while the latter has a value fixed by law and the former has not? I understand that, as a matter of fact, gold can still be laid down in India at something *less* than 10¼ rupees for the sovereign; and that so far the 10¼ rupees rate must yield a profit on the importation. If that be so, then this rate would still seem to be the right one. And the non-arrival of gold must apparently be due to artificial causes, which amount to this, that gold is at a disadvantage as compared to silver, which is favoured by law. If this be so, then the fact that gold sovereigns command in the market at most times a higher price than 10¼ rupees and the 120-grain gold piece a higher price than 10 rupees, must be owing to adventitious causes, and to the circumstance that, the supply of these coins being very limited, there is a sort of fancy demand for them which is no criterion of what their value would be under a different status.

I still hold to the opinion that if it were determined to have a gold currency, we should mainly employ our Indian gold coins for that purpose. I would not object to make the sovereign a legal tender for 10 rupees and 4 annas. But the sovereign being worth 10 rupees and a fraction over, there might be some slight trouble of calculation in changing it for silver, and this would be a drawback in respect of the use of the sovereign as currency in India. And if this objection were urged, I would not press for the sovereign being declared legal tender. But we should continue, under any circumstances, to receive the sovereign in our Treasuries at the present rating.

I believe that a repugnance is felt by some to the present determination of the question of a gold currency in India because of the prospect of some universal coin being adopted internationally. But the prospect seems practically to be almost disappearing. At all events, the Report of the English Commission on International Coinage, presided over by Lord Halifax, seems to be quite adverse to any change in the value of the English sovereign.

I have not dealt with the objection which has been sometimes urged to a gold currency, to the effect that the National Debt, and the paper currency, are calculated in rupees. For the objection has been disposed of more than once in the papers relating to gold. The sum seems to me to be this—we promised to pay in rupees, and we should pay in gold determined by law to be equivalent to rupees.

I have hardly in this paper undertaken to treat of all the points connected with this important subject, still less to discuss all the collateral matters which might suggest themselves for discussion. But the subject in all its bearings has been dealt with in the Report of the Indian Currency Commission of 1867, in the volume of printed papers relating to gold currency in India, in the file of correspondence relating to the revised notification of 1869–70, and in the additional papers now submitted. I am unwilling to add more than I can help to the mass of writing which already exists.

In conclusion, I would ask early and favourable consideration to the proposals of Mr. Dickson, which I will give in his own words:—

"I.—To authorise the receipt of English and Australian sovereigns into all the Government Treasuries of India, without restriction, and whether tendered in payment of Government dues or in exchange for silver.

"II.—In conformity with the provisions of the Currency Act, to authorise the issue of currency notes in exchange for gold bullion tendered at the mint for coinage into Indian gold sovereigns at the rate of 10 rupees for 120 grains of gold of standard fineness, less seignorage."

I believe that these recommendations are safe and practical. They are the first steps towards a gold currency. If they succeeded, their usefulness would be too plain to require description. If they did not succeed, still no harm would be done. If in consequence we were to have any quantity of gold on our hands which could not be conveniently disposed of in India, we could use it for the remittances to England without loss, and perhaps even with profit.

But if, after the adoption of such measures, gold bullion should not be imported; if sovereigns should not be received at the Treasuries; if doubt still existed as to whether the relative value of gold and silver is correctly determined by our present rating and coinage; then I hope that the matter may not be allowed to drop. If the present rating of 10¼ rupees, and the present weight of 120 grains, are not proper (as hitherto we have affirmed that they are), then what rate and what weight are proper? Nobody supposes that we have offered too much silver for the gold; then, if this offer be not the proper one, is it really too little? Ought we to offer more? These are questions which, as I submit, the Government of India ought to be able to determine. These are questions which have been determined by every civilized nation that has adopted a gold currency. No doubt it is a difficult and important problem, but it cannot be insoluble, and it ought to be solved. If the enquiries which have been made, and the data which are available, be not sufficient, then another Commision might be appointed, so that the matter could be brought to an issue one way or the other; and that all the facts and considerations could be brought up to date.

R. TEMPLE.

No. 13.

ACT No. II of 1898.

Passed by the Governor General of India in Council.
(Received the assent of the Governor General on the 21st January 1898.)

An Act to provide for the issue of currency notes on the security of gold received in England.

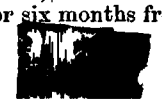
WHEREAS it is expedient to provide for the issue of currency notes on the security of gold received in England; it is hereby enacted as follows:—

Short title, commencement and duration.

1.—(1.) This Act may be called the Indian Paper Currency Act, 1898.

(2.) It shall come into force at once; and

(3.) It shall remain in force for six months from its commencement, and no longer.



Addition of new section after section 13, Act XX of 1882. Issue of notes against gold received in England.

2. After section 13 of the Indian Paper Currency Act, 1882, the following section shall be added, namely:—

"13A. The Governor General in Council may, from time to time, by an order notified in the 'Gazette of India,' direct that currency notes shall be issued at such offices of issue as are named in the order to an amount equal to the value of gold held by the Secretary of State for India at the rate, and subject to the conditions, fixed by that order:

"Provided that—

"(1.) The power conferred by this section shall not be exercised unless the Secretary of State for India shall consent to hold in gold coin or gold bullion what he shall determine to be equivalent in value to the notes so issued, as a reserve to secure the payment of such notes, until he shall transmit the same, or what he shall determine to be equivalent to the same, in gold coin or gold bullion to India, or until the Government of India shall appropriate and set apart in India, as a part of the currency reserve under section 19, an amount of coin of the Government of India equal in value to such notes;

"(2.) Gold coin or gold bullion so remitted shall be deemed to be received, within the meaning of section 19, when it is received in India by the Governor General in Council; and

"(3.) Gold coin or gold bullion so retained shall, until its arrival in India, be distinguished from other gold coin or gold bullion in the abstract account published under section 27."

C.—*Letters and Memoranda containing suggestions as to the method of establishing a Gold Standard in India.*

No. 14.

LETTER from Mr. CLARMONT DANIELL.

SIR,

I TAKE advantage of the intimation with which you have favoured me, that an expression of my views as to the source from which the gold for a gold currency in India could be drawn would be acceptable to the Currency Committee, to state as follows:—

I am of opinion that the proper quarter to turn to for procuring gold for legal tender currency purposes in India is the country itself. A standard money, the supply of which depends on the wealth of the people and their inclination to provide it, is the safest test of the value of commodities, because the supply on these terms grows with the growth of commerce, and expands and contracts automatically with variations in the value and the mass of the goods under exchange in the trade of the country. As a circulating medium such a currency will always be more adequate to the work it has to perform than one of an artificial character, which depends on the management and control of an administrative department for its efficiency. In India, two economic conditions for a regular supply of gold as money are present. A vast treasure of gold available, or at least in part available, for the purpose; and a foreign trade, of which the balance for long periods of time is in favour of that country. The first provides the material immediately required for the coinage of gold money, and the second—from the power with which it invests India as the creditor country to compel payment of foreign obligations due to her in gold—secures a supply of gold from foreign parts to supplement that already existing in the country.

The latter point I need not dwell upon, for, I presume, that it is not open to question. The former is that upon which doubt has been thrown. Quite recently one of the members of your Committee, Sir David Barbour, whose opinion carries—and deservedly carries—great weight, gave it as his decided opinion that the expectation that the people of India would bring out their hoarded gold and put it into circulation as money, would prove quite delusive.*

As I believe that the key to the solution of the currency problem in India is to be found in a change of the standard, and in the ability of the commercial classes in that country to supply all the gold they may require for money without drawing an ounce from the western world, except in the ordinary reciprocity of trade, I beg to submit the following circumstances to the consideration of your Committee.

My estimate of the gold treasure* existing in India, and the way in which I have arrived at it are known to the Committee. It is sufficiently large to provide ten times the gold required for currency purposes. It has been said that the gold required for this object could only be procured by melting down the gold ornaments off the persons of Indian ladies of rank. Whatever portion of this stock of gold may be held in India in the form of jewellery, a much larger portion is held in bars, gold leaf, gold dust, and gold coins of Indian and foreign countries, ancient and modern. The possession of gold in this form is the basis of the credit of many mercantile houses. I take it that there are few traders, among whom it is a universal practice to issue bills of exchange, who do not hold a stock of gold small or great. Were this capable of being coined and used as money, it would serve its present purpose as well as it does now in the form of bullion, and it would obtain the advantage of being open to use as money besides. It is asserted that these stores of gold once coined would go back again into their hiding places, upon the following argument: "A native "banker would say, 'I can get 1,000*l.* sterling for so "many rupees at the present time, and as the ex- "change may go to 1*s.* 3*d.*, and the 1,000*l.* be worth "more rupees, I will take that 1,000*l.* and keep it in "a box and let the rupees circulate'".

This purchase of gold with silver would be a transaction of a very common class, and the trader being a man of business—and it is such persons only whose operations need be considered—would, on the hypothesis, purchase silver when it became 1*d.* cheaper and make his profit, and put his 1,000*l.* into circulation again. It would be in his box or in a bank or perhaps invested in some easily-negotiable security until the turn in the silver market came. The gold would not be hoarded in the sense of being excluded from actual or potential circulation. Mercantile men when they deal in the exchanges expect to realise their profits from a series of transactions, and are not content with buying single bags of gold coins and locking them up for the rest of their lives. Furthermore, dealings of this kind in bullion form a very small part of the whole commerce of the country, for which the use of gold as money would prove in every way beneficial. No doubt gold would be bought to be put away as a provision for old age or against evil times, just as it is in European countries, notably in France, where silver coin is largely hoarded; but in India no more than in that country would this practice interfere with or restrict the use of gold money in trade. The only case which occurs to me in which a trader who might be expected to possess gold and does not, is that of the man who, finding that gold is of no use as money, has long since parted with his stock of gold and substituted silver for it; but this is the class of man who would immediately take advantage of a gold legal tender currency to use gold money in every kind of business in which he could do so with more profit than by using silver.

I have shown that the effect of a demand for coin is to bring out hoarded money.† Thus in the eight years following 1880, 51 millions of rupees, principally, if not entirely hoarded coins of obsolete currencies, were brought to the mints to be recoined with the Queen's head; and I think I have shown that the expansion of trade, and its consequent calls upon the hoarded stores of silver in India, has reduced the hoards of that metal to comparatively insignificant proportions. The same cause, which in the present state of affairs would become from the recent and impending reductions of British minted rupees in India more cogent than ever, may be relied upon to make it more profitable to circulate than to hoard gold money, if it were once made legal tender.

The true basis of a national currency is the wealth of the people, of which stores of gold and silver form one constituent. If a fair field is opened to the use of gold money, it will be forthcoming in such quantities as can be profitably employed in commerce. This is true of the store of silver out of which from the commencement of our rule up to 1893, a large part of the sum of 2,800 millions of rupees had been brought into actual or potential circulation. I believe that estimate of the silver currency of India, as it stood in 1890, is not over the mark, although I understand that one

* "Journal of the Society of Arts," May 1898, page 579.

* "Industrial Competition of Asia," p. 244–249.

† "Industrial Competition of Asia," p. 254, 255, and pp. 315–320.

accepted by Government puts it a lower figure. The same is true of the store of gold out of which the standard money of Great Britain is coined. Both kinds of money are supplied by the free volition of the mercantile classes, acting under the motive of self interest; and with what reason it can be asserted that directly gold is used as money in India, this class of people would run counter to the habits of centuries and to their own obvious interests, and that their proceedings would contradict the universal experience of mankind in this connexion; remains to be stated by those who profess that belief. I venture to say that there is not a scrap of evidence producible in favour of the theory that under our Government in India, the hoarding of gold, which is the result of a sense of insecurity and the uncertainty of trade ventures, would interfere with an adequate supply of gold metal to the mints for conversion into money, by the free contributions of those who desired to use it for profit; and on the other hand, the evidence to the contrary, of which the following is a brief and partial summary, puts such a theory out of court.

That the people of India have used gold money from time immemorial is an historical fact beyond dispute, it is only in British India, and since the demonetising of gold by the East India Company in 1835, that its use has fallen into abeyance. In 1866, Sir William Mansfield, Sir H. Sumner Maine, and Sir William Grey, were appointed by Government to inquire into this subject, and they reported that gold coins of various descriptions were sought for in the Provinces for trading purposes by merchants and bankers, and that the demand for a gold currency was general, almost unanimous. They further ascertained that in Bengal and in Madras bar gold was in circulation in about one district out of every three, while in Bombay gold circulated in the same form in four districts out of every five, and that the hoarding of gold was universal.

Sir Charles Trevelyan, who had a large experience of India, has recorded his opinion that the natives of India have never acquiesced in the exclusion of gold from the currency.

In 1813, the Madras Mint Committee reported that gold had from time immemorial been considered the standard of value by which the pay of the troops and the collection of revenue had been valued; and that in the southern districts of Madras, the introduction of the rupee would overthrow the whole system of native accounts.

Sir John and General Richard Strachey, in their book on "the Finances of India," say that there is no real evidence that the people prefer silver to gold by reason of the small amount of their transactions; that towards the end of the last century, gold coins circulated freely with silver in most parts of Bengal, and about half the revenue was paid in gold; and that during three quarters of a century the impediment to the circulation of gold money has arisen from its not having been legal tender or from its improper valuation in silver.

In 1827, when the new rupee was introduced into Bombay, Mr. Bruce, a member of the Mint Committee, urged that a restoration of the gold currency would facilitate mercantile speculations and promote the convenience of the public generally, and would be the means of conferring a great public benefit.

A great deal more can be added to evidence and argument of this kind, referring to the effects of gold money on steadying the exchanges, on supplying a void, which in the future must certainly often occur, in the requirements of the people for coined money when rupees fail, and on securing for those using gold money the command of the markets; but I will not extend this letter, and I would refer your Committee to those parts of my book already cited, in which the subject is discussed at great length.*

The present seems to me to be an opportunity of utilising to the great benefit of the trade of India, the gold which is stored up in that country. The occasion may not recur for a long while or until some measure with that object is forced upon the Government by the pressure of still greater complications than those which the Committee is now considering; and I, therefore, address you in the hope of counteracting views on the ability and inclination of the people of India to provide their own material for their own gold money, which however widely they may prevail, are, I am satisfied, erroneous in fact, and mischievous in their practical application. On the general question of a gold currency, and the proper means of establishing it and keeping it in circulation, I cannot enter on this occasion without being carried far beyond the scope of this letter.

I have, &c.,
CLARMONT DANIELL.

The Secretary to the
Currency Committee, India Office,
June 25th 1898.

No. 15.

Memorandum by MR. F. ATKINSON, F.S.S., on the method of establishing a GOLD STANDARD for INDIA.

So far as the Government is concerned the main object of a Gold Standard for India is to obtain fixity of exchange for the rupee in its relation to the sovereign within defined limits, in order to diminish, as far as possible, the loss on India's gold obligations to England, while a minor benefit desired is to encourage capital to enter the country for permanent investment, and thus assist its development. So far as the merchants of India are concerned, the same object is also aimed at, but accompanying fixity of exchange, and of greater importance, the conditions must be such as to draw loanable capital into the country to enable trade to be profitably carried on. So far as the people of the country are concerned, fixity of exchange is desirable to inspire confidence in the Government currency amongst the ignorant masses, but this fixity must be carried out in such a way as to cause the minimum of loss to the millions who have wealth in coined and uncoined money.

The Government of India made proposals for a gold currency somewhat on the lines of the system in force in France. These proposals involve the remittance of large sums of gold sovereigns to India, and have therefore been condemned by London bankers, without whose aid it would be practically impossible to carry out any such scheme. The proposals do not contain conditions of convertibility, and on the other hand they contain conditions of further contraction of the currency, which entail a further curtailment of loanable capital and dear money, and consequently the proposals have also been universally condemned by the merchants of India.

The only other scheme that has so far received any attention is the one advocated by Mr. Lindsay; the scheme previously offered by the author of this paper being a modification of that scheme.

The objections raised to this scheme by the Government of India, and by the public in England and in India appear to be—

(1.) That it places the *onus* of unlimited liability on the Government.
(2.) That such unlimited liability must necessarily cause a failure of the scheme, as the gold reserve in England would disappear every time it was replenished.
(3.) That it is failing in its automatic conditions inasmuch as the Government will be required to melt down or coin rupees at their own will and pleasure.
(4.) That England will be drained of gold, by its remittance to India, the sovereign being drawn from the reserve by sterling drafts on London drawn in India.

The replies to these objections are:—

(1.) That without unlimited convertibility of the rupee no confidence can be established, and consequently no loanable capital will enter the country.
(2.) That the working of the ordinary economic laws on the balance of trade and prices will bring about the necessary adjustment, and exports and imports will sooner or later be regulated without infringing on the gold reserve.
(3.) That the scheme is practically automatic, as the condition of the currency will clearly show when it is necessary for Government to take action.
(4.) That there is no reason to suppose that sovereigns would be imported to any greater extent than at present.

Whether the dangers feared actually exist or not is immaterial, the fact remains that London bankers and economists have decided that they do, and without the aid of Lombard Street, no gold standard could succeed in India. The purpose aimed at therefore in the scheme now offered is to counteract the possibility of any such dangers.

(1) and (2). *Unlimited Convertibility.*

There is no doubt that no scheme can be successful in India, without unlimited convertibility at fixed rates within certain narrow limits. Without such a condition no capital will enter the country and without capital a fixed rupee, high or low, is useless to trade. In every country with a successful gold standard, unlimited convertibility is practically a condition, and this is made possible by the power of the country to draw gold into it when wanted, and preventing its export when it cannot be spared. In France, for example, if the gold Reserve falls low, the bank rate is raised, and gold is accordingly drawn into the country, and this rate continues high as long as additional gold is required. It may happen, however, that a more favourable rate is obtainable elsewhere, and the capitalist who sent gold to France may wish to withdraw it to send elsewhere. But it may also happen that France cannot spare it, and she therefore places a premium on its export. This has the effect of keeping the gold in the country, but the knowledge that this may be done does not prevent the gold being sent to the country when the rates are favourable.

There appears to be no reason why a similar principle should not be applied to India, and thus reduce all risk of unlimited convertibility to a minimum.

The suggestion under Mr. Lindsay's scheme is that the rupee is to be convertible into gold for unlimited amounts at rates varying from 15$\frac{3}{4}$*d.* to 16$\frac{1}{16}$*d.* to the rupee, the idea being that this margin of 2 per cent., is a sufficient check on unlimited convertibility by raising the price as the demand increases, whereas on the other hand a wider margin would cause the bank rate in India, whenever money was wanted, to rise to an inordinate height, and thus seriously hamper trade. The example of foreign countries shows, however, that, if the credit of a country is good, and convertibility at a fixed rate is ordinarily obtainable, though an increase on that rate is liable before reconversion under certain circumstances, money can be obtained up to the full limit required. If therefore instead of granting convertibility of the rupee at marginal rates, the rate is fixed, and when a run on gold in the Indian Reserve is made, a premium is charged for it, the demand for gold from the Reserve would at once cease, whilst at the same time the credit of the country would ensure the enforcement of the premium on rare occasions only, and would not therefore interfere with the flow of loanable capital into India. If for example the rate of convertibility of the rupee was fixed at 16*d.* and a run was made on the gold in the gold Reserve in England, following the example of foreign countries, a premium of one or more per cent., according to circumstances, would ordinarily at once stop the demand in India for Sterling drafts. On the same analogy if gold was wanted to replenish the Reserve, a premium on the gold by offering a larger number of rupees for silver bills on India would also prove effective. If on the other hand the gold Reserve in London rose higher than necessary, an adjustment could at once be made by the reduction of one or more per cent. in the number of rupees offered.

(3.) *Automatic Conditions.*

A currency can ordinarily only be absolutely automatic if free coinage of the metal which constitutes the standard exists. A gold currency in India is impracticable, and it would therefore be useless to open the Mints to gold, but there seems no objection to open the Mints to free coinage of silver, after its value had been raised to the ratio it is required to bear with the standard of the country. For example if an import duty was levied on silver, raising its value to 16*d.* to the rupee, there would be no objection to opening the Mint under specified conditions, except that even with its enhanced value, the coinage might become excessive and expand the currency and cause prices to rise, and thus affect the balance of trade adversely. But, on the analogy of foreign countries again, this could be remedied by temporarily raising the rate at which silver is received, and it would cease to become profitable to import it for coinage purposes, and the necessary adjustments would follow in ordinary course, the rate eventually falling to the authorised rate.

If the Mints were re-opened to free coinage under the conditions to be named hereafter, without any other accompanying measures, the rupee would ordinarily continue to gravitate round the point fixed (16*d.* to the rupee), but there would be no finality in such a measure, and consequently no confidence, and both permanent and loanable capital would remain nearly as scarce as at present. The re-opening of the Mints, as suggested, would serve as a prop to the scheme of convertibility by strengthening the position of the rupee at its fixed price of 16*d.*, but the main object gained would be that the supply of currency would be automatic, precisely as if the Mints were open to the free coinage of a gold sovereign worth 16*d.*

(4.) *Remittances of Gold from England to India.*

The remedy for this is simple. No gold is required in India, and if imported, it is imported as a luxury only, and no objections could therefore be raised to an import duty being levied on it. A duty of 10 per cent. would be an effectual remedy, and probably 5 per cent. would be sufficient.

The proposals now offered are accordingly as follows:—

Details of the Scheme.

1. A duty of 10 per cent. (or 5 per cent.) to be levied on the import of gold into India.

2. A duty to be levied on the import of silver into India, so as to make the price of silver bullion equal to the price of silver in the rupee. The duty so fixed to be announced on the Monday of each week.

[The great divergence between the price of silver and its nominal value as a rupee causes bullion to take the place of hoarded rupees, resulting in an expansion of the currency, and in a heavy import of the metal, which provides a serious and hurtful competition with Council Bills, and materially aids in causing an adverse balance of trade. In the three famine years 1873-74, 1876-77, 1877-78, an aggregate of Rx. 3,403,384 in value of Silver was tendered to the mint for coinage in excess of the net import of the metal, indicating the melting down of ornaments. In 1897, the greatest famine year of all, there was a net import of silver to the value of Rx. 7,853,870 which could not be coined, indicating on the precedent of former famine years, that the bulk of the metal took the place of hoarded rupees, inflating the currency, and interfering with the natural balance of trade. The duty will also have the effect of raising the value of silver now in the hands of the natives, and thus preventing, to some extent, the loss caused by the raising of the former value of the rupee in its relation to silver.]

3. The Indian Mints to be re-opened to the free coinage of silver under the following conditions:—

(*a.*) If silver, which has paid import duty, is transferred direct from the vessel to the Mint authorities, no seigniorage will be charged.

(*b.*) If silver already in the country is tendered for coinage, a seigniorage will be charged equal to the price paid if the silver was newly imported.

4. A Government loan of 15,000,000*l.* to be obtained in London and lodged in the Bank of England on account of India. When the gold standard is effectually established, 10,000,000*l.* of this Reserve to be invested in Consols.

5. The system of payment of India's gold debt by the sale of Council Bills to the highest bidder to be abolished and in lieu thereof, silver bills on India to be obtainable for any amount and at any time at the Bank of England at the fixed price of 15 rupees for every sovereign in even hundreds tendered, subject to a minimum tender of 10,000*l.*, and Gold Bills on London to be obtainable at the Presidency Banks in India for any amount and at any time at the fixed price of 16*d.* for every rupee in even thousands tendered, subject to a minimum tender of Rs. 100,000. The gold thus received or drawn in London to be added to, or taken from, as the case may be, the Gold Reserve held in the Bank of England, and the Rupees received or drawn in India to be added to, or taken from, as the case may be, the Government cash balances in the Presidency Banks.

The Home charges to be paid by the Government of India on the requisition of the Secretary of State from time to time according to requirements, by the purchase of gold bills on London at the rate fixed, the equivalent in rupees being retained in the cash balance in India. [A separate fund in India to meet silver bills appears unnecessary]. The money thus realized in London to be transferred to the India Office cash balance for disbursement as required.

6. When the balance of trade goes against India, and a run is made on the Gold Reserve in London, a

premium of one or more per cent. to be charged on sterling drafts so long as the run continues.

[This would be equivalent to France levying a premium on the export of gold under similar circumstances].

7. If the gold reserve falls below a fixed mimimum, silver drafts on India to be temporarily offered at a premium in rupees of one or more per cent. Under certain circumstances, dependent on the state of the reserve, and the run on it, this condition to be put in force in conjunction with No. 6, and to continue till the gold reserve had become sufficiently replenished

8. If the gold reserve rises above a fixed maximum, silver drafts on India to be offered at a reduction in rupees of one or more per cent.

9. If an adverse balance of trade is due to an inflation of the currency, an additional premium of one or more per cent. to be charged on the coinage of Silver. This charge to continue till the necessary adjustments are complete.

Calcutta,
June 15*th* 1898.

No. 16.

LETTER from Mr. J. G. WARDROP, advocating Payment of IMPORT DUTIES in GOLD.

Acland House,
SIR, Colombo, 23rd May, 1898.

I HAVE always taken a deep interest in the efforts of the Indian Government to place the currency of that country on a sound footing, believing that, if their efforts to establish a stable currency at the rate of 15 Rs. to the 1*l.* sterling were successful, it would create that confidence which is required to ensure a steady flow of capital into the country, with its consequent development, and the improvement of the condition of its vast population.

The foregoing is my excuse for laying before your Commission, the following proposals for bringing the present policy to a permanent and successful issue.

1. I would propose that all duties leviable on imports into India be paid to the Government in gold calculated at 15 Rs. to 1*l.*

2. To facilitate the payment of such duties, I would propose that these be made payable either in sovereigns or in special gold notes, the latter to be issued by the Government against deposits of gold, made either in London or at the Government Treasuries in India.

3. The gold notes, issued as above by the Government of India, in India, to be exchangeable, at the place of issue, either for gold or rupees at 15 Rs. to 1*l.* at the option of holders. Gold notes issued by the Government of India in London to be exchangeable for gold only at London, or silver in India. (This latter proviso is necessary to prevent the notes being used as a means of simply transmitting gold from London to India.)

4. It is obvious that collecting these customs duties in gold would have the effect, in time, of gradually replacing the present Government silver reserves by gold at 15 Rs. to the 1*l.*, and of releasing a large amount in silver, and thereby permanently increasing the currency of the country, which is one of the objects aimed at, and that on a gold basis.

5. At a time like the present when currency is scarce in the country, the notes above referred to would be available for mercantile transactions, and if, at any time, exchange rose to 1*s.* 4*d.* per rupee, it is probable they would be to some extent exchanged for silver at the Treasuries, which would still further go to strengthen the Government gold reserve.

6. Seeing that the present policy has been one largely favourable to importers, who have benefited to a very great extent by the recent rise in the sterling value of the rupee, they would have no reason to complain of their having to pay import duties in gold at 15 Rs. to the 1*l.*

7. As the accumulation of gold by the Government, proceeding on the above lines, would be very gradual, it would not have any disturbing effect on the money markets of the world.

8. The fact of the Government holding a steadily increasing quantity of gold as against its rupee currency would have the effect of giving that currency a stability it does not now possess.

9. The use of the gold notes, as proposed, would gradually accustom the mercantile classes to the use of gold in their transactions, and pave the way at some future time for the issue of a gold coin, equal in value to our British sovereign; the silver rupee being ultimately relegated to the same position in the currency of India, as that now occupied by the franc in the currency of France.

10. The collection of custom duties in gold, while the currency of the country is in a different form, is nothing new. In the case of the United States of America, during and long after the Civil War, the custom duties were so collected, and it was found no great hardship to the mercantile community, as I can testify from my own experience in New York.

I am, &c.,
JOHN G. WARDROP.

The Right Honourable
Sir Henry Fowler, M.P.
Chairman of the Indian Currency Commission.

No. 17.

PROPOSALS of Mr. H. P. GYLES.

29, Bread Street, Queen Victoria Street,
London, E.C.

To Right Hon. Sir H. H. Fowler, M.P.

SIR, 28th May 1898.

THE enclosed paper would, I think, solve the question of rupee currency if adopted by Government without a gold coinage in India or upsetting small native transactions in silver; of course the mints to be closed against coinage of silver except for Government demand.

The exports and imports of India about balance themselves. It is Council Drafts, Pensions, Railway Dividends that cause the balance of indebtedness.

This amount after all is small compared with the vast size and now steadily improving position of India.

I certainly think it is worth the while of the Governments of England and India to run some risks to give India a fixed exchange, so that English capital can be sent out and *brought home again* at a certain fixed exchange like 1*s.* 4*d.* You must please recollect that it is the uncertainty of exchange that has kept English capitalists out of India.

Stockbrokers are against rupee investments.

Once give a fixed Government exchange and money could be sent out and brought home this time 10 years without loss.

Light railways are wanted in India, give a fixed exchange and English capitalists would make them.

You see I provide for drawing any large sum in gold from Bank of England by providing that rupee Government currency notes must first be purchased in India with Government silver rupees before they can be cashed for gold in London, the risk of a large operation in this way is so small that it is worth running.

Capital to any large amount coming back from India would have 14 or 16 days' notice, while the notes were coming home by post.

I am,
Your obedient Servant,
H. P. GYLES.

Enclosure to above letter.

I. *In India.*

Gold Standard without a Gold Currency.

1. Make silver rupees legal tender up to Rs. 500.

2. Government currency rupee notes legal tender to any amount.

3. When gold is required in India, offer a small premium. Thus, say, English price is 3*l.* 17*s.* 6*d.* offer 4*l.* There is plenty of gold in India if you are prepared to buy at a price, same as any other article. Government can well afford a premium, seeing the profit on rupees coined at 9½*d.* and sold at 1*s.* 4*d.*

4. By closing the mints the Government have a practical monopoly of rupees the same as the Russian Government have in the rouble.

5. Issue rupee notes or silver rupees in any quantity to customers in exchange for sovereigns at a fixed rate, Rs. 15 = 1*l.*

6. Exchange sovereigns for rupees and currency notes at fixed rate, Rs. 15 = 1*l.* When money is dear in India at shipping seasons there would be a premium on rupee currency notes purchased in England for remittance.

II. *In England.*

At Bank of England.

Issue currency rupee notes on Bombay, Calcutta, and Madras in rupees, payable on demand to any amount asked for, in exchange for gold, Rs. 15 = 1*l.*

Again, cash rupee currency notes sent home from India for gold at fixed exchange, Rs. 15 = 1*l.*

No. 18.

MEMORANDUM by Mr. W. P. SYMONDS.

The literature on the Indian currency problem is sufficiently voluminous, and this memorandum will be confined to an enumeration of the measures which seem necessary for giving stability to the exchange value of the rupee, leaving argument for a future occasion. The proposals are intermediate to those put forward by the Government of India and those associated with the name of Mr. Lindsay. The objects aimed at are to avoid the costly expedients of a preliminary reserve of gold or a gold currency, and to protect the Government from liability of an inconvenient amount.

The plan now in force of issuing rupees in exchange for gold deposited either in London or in India is good as far as it goes, but it has the obvious defect that the depositor can have no confidence regarding the rate at which he will be able to get his money back. Measures are required which will supply this confidence.

The main proposal is that the currency notes now in circulation should be replaced by notes payable either in rupees in India on demand, or in gold in London six months after enfacement by the Secretary of State's representative. The notes might be of the denominations of Rs. 15, 30, 75, 150, 1,500, 15,000, and of the following form:—

"Government of India.

"I promise to pay on demand, after enfacement in "India, the sum of Fifteen Rupees.

(Dated) (Signed)
For the Government of India.

"I promise to pay six months after enfacement in "London the sum of One Pound.

(Dated) (Signed)
For the Secretary of State for India.

"This note will be enfaced in London after it has been enfaced in India."

It is proposed that notes in this form should be issued both in England and in India—to an unlimited extent for gold deposited in London or in India, and in India in exchange for the existing currency notes up to a limit of about four lakhs of rupees in any one day. Later on, the notes might be issued in exchange for rupees at the discretion of the Government.

A minimum rate, say 1*s.* 3¾*d.*, should be fixed for the sale of the Secretary of State's Council Bills, in order that rupees may accumulate in the Indian treasuries if the currency is so redundant as to depress exchange. The rupees should be stored for future use or as security for notes.

A fixed and substantial duty should be placed on silver imported into India. Eight annas per oz. is suggested. Should the price of silver rise to 42½*d.* the oz. (Indian Standard), in which case it is presumed the Indian mints would be re-opened, the duty would be removed.

The Post Office rate for money orders should be fixed at 15 rupees to the sovereign. The inland rate of commission might be charged on orders from England to India. On orders from India to England the commission might be 8 annas the sovereign or 2 annas for five shillings. The issue of money orders is restricted by rules, which would require some modification.

It is believed that the ordinary borrowing powers of the Secretary of State would be sufficient to meet the temporary liabilities entailed by the above measures before gold began to be deposited freely.

The gold deposited in London would partly be retained as a reserve and partly be utilised in meeting the Secretary of State's liabilities, and eventually in reducing the Indian gold debt. The gold deposited in India should be employed in purchasing silver as security for notes, and for coinage when required.

The scheme proposed has great simplicity, and it is believed that it would be effective in commanding confidence, which is all that is needed to keep the rupee steady between 1*s.* 3¾*d.* and 1*s.* 4¼*d.*, and give India the blessings of British capital. The fear is that the present deliberations may result either in nothing effective being done, or in some sweeping and drastic reform being attempted, which might have unforeseen results.

W. P. SYMONDS (I.C.S.),
Postmaster-General,
East India United Service Club, Bombay.
St. James' Square,
27th July 1898.

No. 19.

MEMORANDUM by COMMANDER HASTINGS BERKELEY, R.N., on the INTRODUCTION of a GOLD STANDARD into INDIA.

I assume that the Government of India, though desirous of introducing a gold standard in India, does not wish to disestablish the rupee as a full legal tender coin. If this assumption is correct, it becomes obvious, since that government also desires a fixed par of exchange between the pound sterling and the rupee at the rate of 16 pence to the rupee, that the settlement of the matter involves the introduction into India of a double standard of value, viz. the pound sterling and the rupee at a fixed rate of 1 to 15.

I assume, next, what the Indian Government also assumes, that the closing of the mints in 1893 has effected a relative contraction of the currency and has caused a rise in the exchange; further, that if the mints are kept closed the exchange will continue to rise until the limit of 16 pence (or a fraction over) is reached, when, the India Government being prepared to accept the pound sterling in exchange for 15 rupees, the rise will be arrested.

Instead of criticising in detail the proposals of the India Government, I will briefly state the method I advocate, when, as I think, the comparative inefficiency of those proposals will become evident.

The method is very simple. It consists in:—

(*a*) Keeping the Indian mints closed to silver.

(*b*) Enacting that the pound sterling or 15 rupees shall, at the debtor's option, be equivalent and legal tender to any amount in the discharge of debt.

(*c*) Repealing the Act by which the India Government undertakes to give 15 rupees for every pound sterling tendered.*

I submit that these measures would effect precisely what the Government of India has in view, and what, I believe, its own proposals will not effect, namely, the establishment of a steady par of exchange through the mediation of a marginal gold currency.

It is not difficult to conjecture without making any dogmatic or risky assumption, how these measures would work in practical application. Admitting that the currency continues to contract, whether the process be hastened or not, there will be reached a point—"gold point"—when it will be cheaper to remit gold to India than to buy bills for remittance. But "gold point" being something over 16 pence, it follows, unless the pound sterling be made legal tender for 15 rupees, that it (the pound sterling) will then be rated, in the Indian market, at something under 15 rupees. Now if the India Government is under obligation to give 15 rupees in exchange for the sovereign we can hardly escape the conclusion that, under these conditions, the remitted gold will go to the India Treasury in exchange for rupees. In other words, the expansion of the currency necessary to arrest the rise in exchange will take place in rupees instead of in gold. Hence as we move from the season of active to that of slack business in the India Trade and the exchange begins to droop, there will exist no automatic check to the fall which will continue until we move again from the slack to the active season. Capital will tend to be withdrawn from India as the exchange nears its fixed upper level, and will only be reintroduced when capitalists suppose that it has about reached its unfixed and uncertain lower level, a condition of things which would probably be accompanied by recurring periods of stress similar

* This of course would not affect the obligation of the Government as a creditor, nor its option, as a debtor, under (*b*).

to that which the money market in India is now suffering from. But if the measures which I advocate were adopted, the pound sterling being legal tender for 15 rupees and the India Government being under no obligation to exchange pounds for rupees or rupees for pounds, the gold remitted to India would be forced into circulation; that is, the expansion of the currency would take place in gold. Under these conditions any subsequent tendency for the exchange to fall would be checked by the establishment in India of a "gold point" approximately as much below 16 pence as the gold point in England is above 16 pence.

From the moment, then, when the exchange first rises to "gold point" and gold is actually shipped to India in payment of debt, we should have the inception of a gold marginal currency; and it is clear that this marginal currency, like a tide advancing by wave and refluent wave, would increase so long as the Indian mints were kept closed to the coinage of silver. When the process, in the opinion of the India Government, had gone far enough to provide a margin proof against exceptional disturbances of trade, it could easily be arrested by a restricted coinage of rupees on a principle not essentially dissimilar to that which guides French monetary policy in the coinage of five-franc pieces.

It is perhaps superfluous to point out that the method here advocated could be worked in conjunction with the measures which the India Government proposes for expediting the contraction of the currency, but it would be then unnecessary to raise a sterling loan of greater amount than that needed to replace the loss to the Indian Treasury on the melting down of rupees.

No. 20.

PROPOSALS of MR. SLATER, late of the Union Bank, London, for establishing a GOLD STANDARD IN INDIA.

Waverley, Swanage, Dorset,
SIR, 12th December, 1898.

A visit paid by me to India, some twelve months since, drew my attention particularly, as a business man, to the subject of the local exchange, and the condition of the currency in the country, which, if not caused, had certainly been largely affected, by the heavy fall in the value of silver in the markets of the world. Into the origin of this serious depreciation, it does not import now to enquire, suffice it to allude to the fact that the intrinsic market value of the coins in circulation in India has decreased since 1860–70, by one-third. As the volume of the circulation in 1886 was estimated by Mr. F. C. Harrison at 115 crores, this implies a loss to the community of 38 crores, or more than 25,000,000*l.* The extent of this shrinkage is in itself sufficient reason for the appointment of the Indian Currency Committee to deliberate upon the proposals made, in several quarters, for the establishment of such practicable and practical remedies as may be best adapted to combat the existing evils.

In face of the difficulties prevailing, I ventured to enter into the discussion of the subject through the columns of the *Bombay Journal* and the *Times of India*, referring to the suggestions of the Government of India, of Mr. A. M. Lindsay, and of Mr. Probyn. Whilst acknowledging the desire of all of them to attain, if possible, that much-to-be-wished-for end, a fixity of exchange, I attempted to show that the redundancy of the rupee, to which they attributed much of the deplorable condition of affairs, was not to be remedied by the crude expedient of throwing the coins into the melting-pot, and of selling the bullion thereby obtained to the extent, if need be, of 20,000,000*l.*, replacing such silver coins according to Mr. Lindsay's plan by a reserve to be held in London of gold.

The carrying out of this suggestion would certainly have had the effect of reducing the number of coins current, but would in all probability have had the mischievous consequence of still further reducing the market value of silver, and thus of intensifying the evil. The Government, it is true, proposed to replace the silver thus abstracted by gold coins of equal value, permitting coins of both metals to be legal tender to an unlimited extent, and establishing a ratio under which gold and silver rupees should be interchangeable by a Government establishment. This, however, would not have satisfied the foreigner, who declines to receive payment of his demands in a currency which, as a whole, would not be greatly appreciated by this shifting about of coins, for he would have had no guarantee of receiving payment in gold.

The subsequent course of the money market in the large commercial centres, where accommodation was not to be had under, even if at, 18 to 20 per cent. at the end of 1897, showed that a redundancy of rupees was practically no longer existing.

Both the Government of India and Mr. Lindsay suggest that a reserve of gold should be held to aid the early establishment of a gold standard and a stable exchange. The former would have this in India, the latter in London, neither one nor the other, however, being ardent advocates of a circulation amongst the community in India of a gold currency. These proposals being both before the Committee, I need do no more than allude to the above points, in order that they may be contrasted with my own suggestion, merely adding that by all economical principles it is unwise, and, indeed, impossible, to attempt to establish a binary standard. Experience shows that all such efforts eventually end in the disappearance from circulation of the metal of greatest *pro ratâ* market value, which is absorbed by the holders of the metal of least market value.

I therefore suggested in the last of my letters above referred to, addressed to the *Times of India* on 24th June last, that the currency of India after an early date to be fixed (I named the 1st July 1899), shall be based solely upon gold.

I further proposed that the Indian mints should strike and issue gold coins weighing respectively 123.2744 grains, and 61.6372 grains troy, of $\frac{22}{24}$th fineness, which shall be available as legal tender in payment of all sums, after the rate of 15 rupees for the larger coins, and of seven rupees, eight annas for the smaller ones, If found more convenient for the purpose of circulation, coins of, say, 10 rupees containing 82.18298 grains, and of 20 rupees containing 164.36596 grains, of the same standard, might be issued. These coins would be the equivalents in British money:—

7½	rupees of	10*s.*
10	,,	13*s.* 4*d.*
15	,,	1*l.*
20	,,	1*l.* 6*s.* 8*d.*

I also proposed that British sovereigns and half-sovereigns should be legal tender for payments in India, after the rate of fifteen rupees, and seven rupees eight annas respectively.

The fact that the standard of fineness both of British and of Indian gold coins would be identical implies, of course, that like weights of either coinage would have an equal value, which would be a commercial advantage.

As in the case of the gold coinage of the United Kingdom, I suggest that a similar remedy should be allowed, say—

In the case of the	7½	rupee piece of			0.15000	grains.
,,	,,	10	,,	,,	0.175000	,,
,,	,,	15	,,	,,	0.20000	,,
,,	,,	20	,,	,,	0.25000	,,

within which limits they shall be legal tender in all payments.

With the view of providing bullion to carry out the preceding suggestions, authority should be taken by the Indian Government to raise from time to time, by instalments of 5,000,000*l.*, a total of 20,000,000*l.* in the London market, by short loans or Treasury bills, for the purchase of gold as required for coinage. Seeing that the finished coins will only be issued for value received, this involves merely loss of interest during the brief period the funds received remain under control of the Government.

In India where the currency at present may be described as exclusively silver, and where that metal, even after the introduction of a gold coinage, will still form the preponderating proportion of the coins in use, I estimate that the above fund of 20,000,000*l.* will prove amply sufficient to furnish a supply of gold coins adequate to the requirements of the country. If, however, in consequence of the gathering importance and extension of the trade of the country, this is found to be insufficient, no great hardship or difficulty would be felt in increasing it.

The coinage of gold at the London Mint during the past few years has varied annually between 2,000,000*l.* and 9,000,000*l.* in round figures, and, leaving out the exceptional year 1892, has averaged under 6,000,000*l.* If necessary, the London Mint might be called upon to

assist in the production of the Indian coins without any great inconvenience to that institution.

Objections have been raised to the introduction of a gold currency, that coins in that metal are at variance with the habits and idiosyncrasies of the population and not fitted for them. This, however, is a statement not based on facts. We know that a gold currency *was* in vogue in India prior to 1806, and the Court of Directors of the East India Company, on 25th April of that year, addressed a despatch to the Governments of Bengal and Madras, in the third paragraph of which they pointed to the loss and inconvenience sustained from the circulation of so many denominations of gold and silver coins of different values in different districts. It appears further from their report that in the several provinces, Sicca, Arcot, Bareilly, Benares, Sonant, Lucknow, and Bombay rupees (each of which, it may be remarked, contained a different quantity of fine silver) circulated side by side with gold star pagodas and quarter gold rupees, the latter coin approximating to, but not identical in value with, the former.

The directors recognised the fact that, even though the proportion of interchangeable value of gold and silver coins might be fixed by law on the justest principles, yet inevitable fluctuations in the market value of the metals would lead to the absorption of the more valuable metal, and would create continual difficulties, so that the establishment of such a principle of a bimetallic standard would, of itself, tend to perpetuate the loss and inconvenience.

The Directors also stated, in paragraph 26 of their despatch, "the pay of the troops is frequently issued in pagodas," so that we may, in the present day, safely dismiss the idea that a gold currency would lead to dissatisfaction, either amongst our forces or the inhabitants of India generally. That so many coins, with such complex relative values, were simultaneously in circulation is certainly evidence that a simple system of gold and silver coins (the latter being recognised as mere tokens of the former) would not, at the end of the century, be regarded as objectionable.

Whilst the Directors agreed with the Earl of Liverpool that the money or coin, which is to be the principal measure of property, ought to be of one metal only, their undoubted opinion was that such coin should be of silver, but they were by no means desirous of checking the circulation of gold upon a principle fitted for general use.

Another objection to the use of gold currency is referred to in the *Pioneer* newspaper of 6th January, 1898, describing Mr. A. M. Lindsay's scheme. That gentleman, they say, thinks handy gold coins, of full metallic value, will be much in request in India (amongst other demands mentioned by him) for hoarding, for which purpose they would be preferred to silver coins. Objectionable, in some respects, as hoarding may be, a smaller number of the members of the community would be incommoded by the exercise of this habit with gold rather than with silver coins. One fruitful cause of hoarding throughout India is the necessity, which parents hold to be indispensable, of providing funds sufficient to defray the expenses entailed by the marriage of their daughters, which I have heard estimated, even in the case of people in a very humble sphere of life, as at seldom less than 50*l.* and upwards, which has to be gathered together, rupee by rupee, from the scanty earnings of the parents. Most of these coins will again be set free and in circulation when the happy event comes off. Ornaments will no longer be made of rupees melted down, as hitherto has been so frequently the case, but of silver bullion, probably imported.

The precious metals are at bottom mere commodities, and this principle is not annihilated by the impression of a die upon the face of a coin, which acts as a guarantee of the quality of the material, and in that sense enhances the property inherent in the metal, which at all times and under all circumstances represents the command of so much labour.

To discourage hoarding, as well as to prevent loss from abrasion attendant upon passing coins from hand to hand, I suggest that the Government should be authorised to receive gold coins from the public, issuing in lieu thereof either their notes repayable in coin on demand, or Exchequer bills to bearer or order, at short dates, carrying a small amount of interest payable half-yearly. To intercept the small hoardings, I would suggest the establishment of Post Office Savings Banks similar to those obtaining in this country.

Another objection, that the withdrawal of so much gold from the London market as would be required to carry into effect the establishment of a gold currency in India, is in these times, when the production of the precious metal is so largely increasing by rapid strides, not worthy of consideration.

The difficulty of maintaining a sufficient gold reserve would not be thrown upon the Government, but would be combated automatically. As a rule, the principle which applies to the individual, applies also to the community. This principle of self-interest acts as a stimulus to industry, serving to elevate separate members of the community and trade centres generally, urging them to increased production, and consequently increased exports, thereby enlarging in favour of India the balance of trade, which is sure eventually to be paid by foreign countries in gold. In the case of silver-using countries, such as China, &c., this may involve a longer process, but all such countries eventually will, from the force of circumstances, and in the natural course of things, be compelled to adapt themselves to the recognition of gold as the common measure of value throughout the whole commercial world. The knowledge that the falling tendency of silver is not likely to be arrested permanently cannot fail, in the long run, to remove this objection which, as it is, applies now only to the minimum percentage of Indian trade.

A fixity of the rate of exchange within a small margin, to which a gold standard cannot fail to contribute, will, so soon as a demand arises, attract foreign capital to the money markets of India, whether for short periods or for permanent investments, if a sufficient return in the shape of interest (which always rules higher in India than in Europe) and adequate security be offered, without which contributions, either in the shape of gold or silver, cannot be looked for. This fixity of exchange I anticipate, for the above reasons, will lead to the cessation of the excessive periodical demand for capital and accommodation in India, and tend to equalise rates throughout the year, although the movement of crops will not prevent a seasonable as well as a rational rise in the value of money in the market, and a natural effect upon the rate of exchange, although this last will not be accompanied by wild fluctuations, such as have been witnessed since the the fall in silver.

The introduction into India of a system of coinage based solely upon gold, of necessity reduces the rupee to the position of a mere token. I would, therefore, further suggest that to give effect to this fact it should be decreed by the Legislature that silver rupees should not be available as legal tender for payments in excess of:—

1,000	rupees	after	December	31st,	1900.
800	,,	,,	,,	,,	1901.
600	,,	,,	,,	,,	1902.
400	,,	,,	,,	,,	1903.
200	,,	,,	,,	,,	1904.

By the above plan, which is thrown out as a suggestion, and is necessarily open to modification, the current silver coinage will be let down by easy grades into the position it is intended it shall occupy in the future.

I further suggest that all coinage, whether of gold, silver, bronze, or other metal, shall be made by or under the control of the Indian Mint authorities only.

The closing of the mints in 1893 I consider to have been a wise measure, and cannot but wonder that it was not earlier adopted. The principle of allowing all the world to bring in silver bullion to the mint, purchased in the open market, and that a depreciated one, at a price far below the nominal value of the coin into which they demanded that it should be manufactured, was, I conceive, mischievous in the extreme. No wonder that a redundancy of rupees was complained of, when the Indian mints were made the dumping ground of all the silver that speculators could buy and sell again under conditions so favourable to themselves.

However, as in England, I would allow outsiders to bring gold, but *not* silver or other inferior metals, into the Mint, in quantities not below a minimum of weight and fineness to be fixed, to be converted into current coins, subject to certain charges for seignorage. The coinage of silver or other metals I would confine strictly to the Government, when it became evident that the community required a further issue of subordinate coins. As the bullion would be purchased in the open market by the Government, a considerable profit would be derived therefrom, the benefit of which would accrue eventually to the public.

From the preceding statement of my views on the subject of Indian Currency, it will be seen that I do not

propose to the Committee to recommend a measure which shall be either unjust or prejudicial to the present holder of silver rupees, each of which intrinsically is worth no more than two-thirds of its face value, and I leave in circulation the well-known and (in India) universally received coin with a fixity of value it has really ceased to maintain under existing circumstances. I do not propose to reduce the amount of coin in circulation; on the contrary, by the introduction of gold I actually increase it, but with this safeguard, that the money market is not likely in consequence thereof to be flooded with additional capital, in view of my suggestion to limit the power of the silver rupee as legal tender, thus leaving for the ordinary transactions of life practically the whole of the coin now in circulation.

Exception has been taken in some commercial quarters to the apparent determination of the Government to fix the value of the sovereign at 15 rupees, or 16 pence per rupee, and it has been suggested that the latter coin should be valued at no more than 1*s.* 2*d.*, or 12½ per cent. below the Government proposal. I must confess that I look upon the proposal of the Government as the more reasonable of the two. It is not so many years ago that exchange was much higher, and the rupee then approximated in value to 2*s.*; but, notwithstanding this serious decline in the value of the coin, wages have risen very little, if at all, thoughout the country. This, of course, means that the purchasing value of the rupee, so far as concerns all imported articles consumed by the peasant, has declined, even at 1*s.* 4*d.*, by upwards of 30 per cent., amounting, consequently, to a serious fall in wages. The rupee prices of articles of native production do not appear to have risen during this period, but the adoption of a 1*s.* 2*d.* rupee would vastly add to the cost of all imported articles of husbandry, such as machinery, &c., the tendency of which would be to reduce agricultural wages, or, at any rate, to prevent their rising. On the other hand, the exporting merchant, supposing sterling prices did not fall in consequence of the reduction of the cost of production (a supposition which the known facts might materially modify) would reap all the benefits at the cost of the producer. This naturally would greatly prejudice the interests of the producer, upon whom the burden of the loss would fall. Taking all things into consideration I maintain that the interests of the humbler members of the community, who can scarcely help themselves, should be preferred to those of the more intelligent commercial classes, who are well able to take care of themselves, and, as a rule, do so. Besides this, the suggested reduction of the value of the rupee would seriously affect the position of the Government, and involve the necessity for further taxation, which in most quarters would be regarded as not only deplorable but also as possibly dangerous to sound administration.

From the foregoing it will be seen that I consider it, under the prevailing circumstances, absolutely imperative to do away, as speedily as may be possible, with the existing silver standard in India, and to introduce a gold standard on some such lines as I have indicated.

I have, &c.
R. SLATER.

Robert Chalmers, Esq.,
Secretary to the Indian
Currency Committee.

No. 21.

MEMORANDUM by Mr. WILLIAM WARRAND CARLILE.

The method of dealing with the Indian Currency problem which I beg to submit for the consideration of the Indian Currency Committee, is briefly the following:—That the Committee should make it their first business to arrive at a conclusion as to what may now be regarded as being the probable natural exchange value of the rupee, for the ensuing year, under existing conditions; and that point having been decided, that they should consider the advisableness of recommending that a ratio should be fixed by statute, at or very close to that figure, at which both the sovereign and the rupee should be made unlimited legal tender in India, in all transactions, and that the mints should be opened to the free coinage of gold.

In support of the above recommendation I beg to submit the following:—

(1.) It was the natural and obvious course that, in the first instance, suggested itself to Lord Lansdowne's Government in 1892. Sir David Barbour's proposal then was first to stop the free coinage of silver, next, after an interval had been allowed to elapse sufficient to enable the Government to ascertain what effect the stoppage of the free coinage of silver had had upon the value of the rupee, to open the mints to the free coinage of gold, and to make gold legal tender in India, fixing the ratio between the sovereign and the rupee approximately in accordance with the value to which the latter had settled down. The conception of the true policy to be pursued was, in short, to let the public fix the ratio in the first instance, and then to stereotype this ratio by making it the official one by statute. It will be remembered further that this policy received the very emphatic endorsement of the late Mr. Bertram Currie, in a memorandum appended to the report of the Herschell Committee.* In that memorandum, he expressed his disagreement with the recommendation of his colleagues to the effect that an announcement should be made forthwith that rupees would be given by the Government in return for gold at the rate of 15 to the sovereign, and recommended instead that, in the meantime, the mints should simply be closed without any such announcement, and that after an interval had elapsed sufficient to guide the Government in deciding as to what had become the natural value of the rupee under the new conditions, the ratio should be definitely fixed, and the mints should be opened to the free coinage of gold.

(2.) This fixing of a maximum value for the rupee in 1893, while its minimum value was left unfixed, has been the source of much subsequent trouble and confusion of thought. Among others of its mischievous effects, it has had that of creating an impression that, in some sense, a statutory ratio between gold and the rupee exists already, and of thus obscuring to the public mind the necessity of fixing one before the silver currency can be expected to circulate at par with gold in the country. The present Indian Government, for instance, appear to anticipate that a state of things will come about of itself in which the sovereign will "become a recognised coin of the empire" and in which gold and silver will circulate side by side, the one as standard money (and the other as subsidiary, and they make accordingly no proposal to fix by statute the ratio between the two. Now it is possible to point to a long list of countries in which the gold and silver coins circulate together at par just as if they were different sub-divisions of the same substance, and in which also one can lay his finger on the statute which fixes the ratio at which each shall be legal tender, but I think it is not possible to point to a single instance of a country in which gold and silver thus circulate at par without any statute or ordinance fixing the ratio.

(3.) It will then perhaps be admitted without difficulty that, before the Indian Government's ideal can be realised, gold must be made legal tender in India, and it will further perhaps be admitted that gold cannot be made legal tender, while the rupee is legal tender also, without fixing the ratio between the two. The recommendation therefore at the head of this paper recommends only the doing of that at once which must plainly be done sooner or later. My contention, however, further, is that if the step recommended were taken, no other step need be taken; that the simple fixing of the ratio say at 1*s.* 4*d.*, and the opening of the mints to the free coinage of gold, while keeping them closed to silver, would itself be sufficient to maintain the value of the rupee definitely at that figure.

(4.) As to the mode in which such a legal tender act would operate in bringing about and maintaining the parity between the rupee and gold, it is, perhaps, easier to follow it if we suppose that, in the first instance, an order was issued, making the pound sterling, instead of the rupee, the standard of all computations in connection with Government business in India, all payments in rupees being converted, at the market rate, into payments in pounds sterling, and, henceforward, all taxes being

* Appendix to Minutes, Herschell Committee, p. 148, sec. 6.

collected in terms of pounds sterling, rupees being accepted in lieu of gold at the rate of, say, 15 to the sovereign. The total rupee circulation is estimated at about 120 crores, and the revenue may be put at about 100 crores. The fact therefore of the revenue being collected in rupees, but in terms of pounds sterling, would be equivalent to the redemption annually in gold of five-sixths of the rupee circulation. A practically unlimited market would thus be provided for the rupees at a fixed gold price. The holders of them, knowing that such a market was always open, would soon cease to have any fear of their fluctuating, and would keep them by them in the slack season for use in the busy season, precisely as if they were fractional gold pieces. This fact in itself would obviate any danger of redundancy. It was, as Professor Laughlin remarks, this virtual redeemability in gold, by its receipt in payment of taxes at a fixed ratio to gold, that, in America, maintained the silver and the certificates based on it, which are not directly redeemable in gold, at par with United States notes which are. It seems certain indeed that a value for the rupee could thus, without difficulty, be maintained, even considerably above its present market value. On all grounds, however, both of justice and of expediency, the present market value should be as closely as possible adhered to.

(5.) If, further, the ratio were fixed, it would henceforth be impossible for any one to obtain rupees from the Government at a price below that fixed on. There could be no such thing then as selling Council bills, that is, orders for rupees, at anything under 1*s.* 4*d.* per rupee (supposing 1*s.* 4*d.* to be chosen) as all bills on India would be sterling bills, though, of course, a pound sterling in India might mean either a sovereign or 15 rupees at the option of the acceptor.

(6.) It need hardly be said that if it should be thought important to avoid a change of nomenclature from rupees to pounds sterling, that change could be avoided while carrying out the above recommendation (Section 4) in all essential points. The Indian sovereign might always be described as a 15-rupee piece (Rxv. perhaps) or by some equivalent designation less awkward.

(7.) In many of the discussions on the subject of the Indian Currency it seems to be assumed that the parity of the rupee with gold cannot be ensured without direct convertibility between the two being guaranteed. The experience, however, of a great number of countries which possess standard and subsidiary coinages not directly convertible into each other, yet circulating together perfectly at par, is against that conclusion. An instance which, it seems to me, has not received the attention that it deserves is to be found in the case of England itself in the 18th century. During a great part of that century the worn and light shillings which were not intrinsically worth more than the thirtieth or fortieth part of a guinea circulated steadily along with it at the fixed ratio to it of twenty-one to one. The fact that they did so is one calculated to bring the power of an Act or ordinance fixing the ratio between the standard and subsidiary money in making that ratio effective into a very strong light indeed. The facts were briefly as follows:—At the end of the 17th century silver was the undoubted standard in England in every sense. The guinea went up and down in value like any other commodity, and the foreign exchanges varied in accordance with the condition of the silver coinage. When we turn, however, to the middle of the 18th century—when next information with regard to monetary conditions is available—we find that the very state of things which exists at the present day had already come into existence. Gold we then find to be the standard, and silver merely subsidiary money. The state of the silver coinage had not then, we find, the smallest effect on the foreign exchanges. The exchanges, on the contrary, were ruled exclusively by the state of the gold coin, together with the balance of trade. So long as the guineas were of full weight, the mint price of gold ruled at 3*l.* 17*s.* 10½*d.*, as at present. The fluctuation in the value of gold coins was already a thing of the remote past. How did this all come about? The only thing that happened between the end of the 17th century and the middle of the 18th century which was calculated, in any way, to alter the situation, was the fixing of the value of the guinea in silver, in 1717. The rate fixed on virtually closed the mints to silver, as, thenceforward, to the close of the century, it paid no one to bring silver to the mints to be coined; the mints were thus left open to gold only. At the same time, it made the silver, to all intents, redeemable in gold, by its availability for the payment of taxes at a fixed ratio to gold. The measure was intended to fix the value of gold in silver, but ended instead by fixing the value of the silver coin in gold. The silver was already unlimited legal tender, and was thus available for the payment of taxes, as the rupee is in India now. That alone, of course, did nothing to fix its value. As soon, however, as gold was made unlimited legal tender at a fixed ratio to it, the whole situation seems to have been at once altered. Thenceforward the silver coins seem never to have shown the smallest tendency to vary in value, however light and worn they became. We have, then, here an instance in which the silver, though unlimited legal tender (as it was till 1774) was made to circulate at a fixed parity with gold, by the mere efficacy of the ordinance fixing the ratio, together with the virtual closure of the mints to silver, and without anyone having so much as dreamt of accumulating either a gold reserve to redeem the silver, or a silver reserve to redeem the gold.

(8.) The misgivings which the Indian Government express with regard to the clauses of Mr. Lindsay's scheme, which propose that the Government should guarantee the convertibility of the rupee to all and sundry at a fixed rate, seem to me not to be without just ground. Suppose that, after the announcement had been made that the Government would accept all rupees at 1*s.* 3¾*d.*, and would give gold for them, a rumour got wind—it might be without the smallest foundation—that the scheme was breaking down and was about to be abandoned, that the mints would be re-opened to silver, and that a fall of 30 per cent. in the value of the rupee might any day be anticipated, it is quite conceivable that there might be an ugly rush for gold while it was still to be got at a fixed price. We must take into account the fact that we have a vast, ignorant population to deal with, exceptionally liable to unreasoning panic, that there are great interests hostile to the fixity of the rupee, and that immense fortunes are to be made by finding the weak point in any scheme that could be proposed, if it has one, and by wrecking it. The Dutch Government, of course, take an entirely opposite stand to that suggested by Mr. Lindsay. To the question "Can persons holding silver coin require the Government or any national bank to give them gold for it," the clear answer is "No they cannot," and I think the answer will have to be the same in India. It is quite certain that, in spite of their taking this stand, the Dutch Government, and many other governments similarly situated, have been able to maintain their appreciated silver at par with gold. Surely the first matter for inquiry in the Indian case is whether by the adoption of the same course it is not possible to attain the same end, before thinking of adopting a course so much more hazardous as that of guaranteeing universal direct convertibility would be. A legal tender act fixing the ratio is not, it need hardly be said, for a moment to be confounded with a guarantee of direct convertibility. Such an act, on the contrary, gives in express terms to all tenderers, the Government included, the option of paying in whichever medium they please.

(9.) An inquiry which I have not seen set before the Committee in express terms, and yet which is, I think, one fertile in important results, is the inquiry:—"What, at the present moment, is the standard of India?" It plainly is now not silver. A high authority recently tells us that it is "exchange." That, however, is a doctrine that can assist us little. The standard of value in a country must, at any rate, be a concrete substance, and cannot conceivably be an abstraction. I have endeavoured in my paper on the Indian Mints to show that the standard of India is already gold—arriving, on that point, at the same conclusion as Mr. W. Douglas, author of the "Indian Currency"—and I think, indeed, that the same view is unconsciously and implicitly taken by every one

who speaks of the "depreciation" of silver in India. Depreciation can only be depreciation in comparison with some standard in the background, and that standard can, in this case, be nothing but gold. If, however, the standard of India is already gold, the official recognition of gold as the standard by the opening of the mints to its free coinage, and by fixing by statute a ratio between it and the subsidiary silver, cannot certainly make the outside gold obligations of the country any harder to meet than they are under the present state of things. Now this much is certain, that India, somehow or other, meets her foreign gold obligations, at the present moment, without a gold reserve; and the question arises, would a gold reserve be any more necessary, under the new conditions, that is to say after the mints had been opened to the free coinage of gold, and gold had been made legal tender at a fixed ratio to the rupee, than it is at present. There is of course a theory that a fall in exchange forces a favourable trade balance by increasing exports and diminishing imports; but, setting aside that theory which receives no support from statistics, which is contrary to all sound principle —involving indeed, as it would, the conclusion that any nation in financial difficulties has only to depreciate its currency to find an easy escape from them—there seems to be no reason for asserting that the accumulation of a gold reserve is a necessary preliminary to what is called the adoption of the gold standard in India, that is to say, to the fixing of the ratio and the opening of the mints to the free coinage of gold.

(10.) When a country possesses, as India does at present, a currency that cannot be exported, or at any rate, that, as a matter of fact, never is exported, and when it possesses no gold reserve, there is plainly only one way in which its outside gold obligations can be met, that is by the trade balance in its favour. But suppose circumstances to arise which would tend to make the trade balance unfavourable — say a great diminution of exports owing to a famine—how then can they be met? Plainly the true answer is, that a country so situated can never let the trade balance become unfavourable to it. If circumstances are such that the meeting of her obligations directly would make the trade balance unfavourable, she must, as long as she has credit, borrow, in one shape or another, and thus keep it favourable. In the case of a country which had a gold currency and no gold reserve, it would be obvious enough that the only way in which its Government could meet outside obligations in gold which would not, in ordinary circumstances, be covered by the trade balance in its favour, would be either by increasing the taxation or by borrowing. In the case of India, however, with her appreciated silver currency, it seems generally to be assumed that there is a third method open of meeting outside obligations. She can sell her Council bills, it is said, cheaper than she would sell them otherwise, and can thus raise a larger sum than she could otherwise, to meet these obligations. It is true of course that she can do this, but it is also plain that doing so is only another form of borrowing. If more bills are sold than the public want for immediate requirements, they can only be sold to people who buy them on speculation, and who intend to hold them, in the meantime, till they can dispose of them to advantage, and such sale, in such circumstances, is plainly equivalent to drawing on the future—to obtaining money in advance. It is, on the face of it, indeed, absurd to imagine that the fact of having a token currency gives a country an advantage, as regards meeting its obligations, over countries with a gold currency. If a gold currency country would, in given circumstances, have to meet its obligations abroad, either by borrowing or by increasing its taxation, it is quite certain that a token-currency country, in the same circumstances, will not be able to meet them in any other manner.

(11.) In 1893, the maximum value of the rupee having been fixed by an edict at 1*s.* 4*d.*, an attempt was made to fix the minimum, for a time, at 1*s.* 3½*d.*, by refusing to sell Council bills under that price. The amount of Council bills required to meet current obligations could not be sold, and direct borrowing had to be resorted to. This borrowing was the subject of much hostile criticism at the time, and it was accordingly decided to end it, and instead to sell Council bills below 1*s.* 3½*d.*, indeed at whatever price could be got for them. The result has been a loss of revenue amounting in all to about 8,000,000*l.* to India, since 1893, as compared with the revenue that would have been obtained if the price of Council bills had been kept up. The question is, how much would it have cost India, in the shape of interest on borrowed money, to have maintained the price of Council bills? Probably only some small fraction of 8,000,000*l.* The mistake made by those who urged the sale of Council bills at any price lay in their failing to recognise that such a sale was merely borrowing in another form, and that a ruinously expensive one.

(12.) The fixing of both maximum and minimum for the rupee in 1893, amounted, of course, to an attempt to completely fix the ratio. Why then did it not succeed? The mistake lay in this, that while the maximum was fixed by an edict, the minimum was only fixed as a measure of policy, and the decision fixing it was known, from the first, to be liable to be changed at any moment, and was, as a matter of fact, changed within about six months from the date of its adoption. In such circumstances, no one, from the first, could have any confidence in the maintenance of the value of the rupee; no one, therefore, could safely keep rupees by him for future use; and, thus, everyone being driven to force them on the market, they could not fail to become redundant. The case would be altogether different, if both the maximum and the minimum had been fixed at once by a step that would be practically irretraceable, that is, by the passing of a statute opening the mints to the free coinage of gold and fixing a ratio at which both the sovereign and the rupee should be legal tender in all transactions.

(13.) While it is the case that India, after the opening of the mints to gold and the fixing of a ratio between gold and the rupee, would, even without a gold reserve, be in quite as good a position to meet her outside gold obligations as she is at present, it by no means follows that it would not be desirable to place her in a better position than her present one. The fixing of the ratio, however, instead of being looked upon as something that should only follow on the accumulation of a gold reserve, should be looked on as the first step towards making the accumulation and use of a gold reserve possible. A gold reserve, such as that suggested in the memorandum from the Indian Government, which is not in any circumstances to be parted with, is plainly not a gold reserve, in the ordinary sense, at all. A gold reserve is, indeed, I think, something that can only be made available after the gold standard has been brought into full working order.

(14.) If the Dutch system were imitated by making gold legal tender at a fixed ratio to the rupee, it might eventually, if not immediately, be further imitated by following the practice of the Bank of the Netherlands in being prepared always to give gold to meet a *bonâ fide* demand for it for export, the *bona fides* of this demand being evidenced by the fact of the exchange being against the country. The operation of the scheme would then be very similar to that of Mr. Lindsay's scheme, without however, incurring the risk of an internal drain, which his altogether fails to obviate. With regard, to that scheme it is worthy of note that while it proposes in form to guarantee universal convertibility for the rupee, it absolutely relies for its success on the anticipation that there will be no internal demand for its conversion. Mr. Lindsay, himself, describes his scheme as one that will secure "full and free convertibility for the rupee for foreign payment purposes," instead of (like the Government of India's scheme) "partial convertibility for foreign payments combined with "partial convertibility for local payments and for "hoarders." He expects thus, it will be seen, to level up the rupee by meeting the demand for gold for export only. If doubt should remain in the mind of any members of the Committee as to whether the simple fixing of the ratio would be effective in maintaining the value of the rupee, it might still be worth their while to consider whether, with this proviso added, that gold should always be furnished to meet an export demand, the plan would work satisfactorily. As the real exchange is ordinarily in India's favour, the amount

of reserve required to ensure the ability always to furnish gold in such circumstances could not be large.

(15.) It seems to me, in the highest degree, improbable that the fixing of the ratio at 1*s.* 4*d.* now would lead to an accumulation of rupees in the treasuries as, under very different conditions, in 1893. Still it would, no doubt, serve the important purpose of promoting, from the start, public confidence in the ultimate success of the scheme, if the Government were to arm themselves with power to melt and sell rupees in such an event. The Dutch, in like circumstances, armed themselves with similar powers, but never had occasion to use them.

(16.) If a gold, or partial gold, currency is the desired eventual goal, the plan proposed is clearly the only road to it.

No. 22.

MEMORANDUM by Mr. E. KLEINMANN, Administrator of the *Crédit Lyonnais*.

Rapid and Decisive Success of the Monetary Reform notwithstanding numerous obstacles and strenuous opposition on the part of Speculators in Indian Exchange and Silver.

The opponents of the monetary reform repeatedly maintained that the scheme had completely broken down. Those who have only a superficial knowledge of monetary matters imagine that a reform of this kind could be carried out within a very short time, for instance, a few months or a year. A competent and impartial study of the scheme will, however, easily show that the object in view could only be attained after having been in operation for some considerable time.

One must not lose sight of the fact that the reform had to be introduced into an empire with a population of 300 millions of inhabitants, mostly ignorant people incapable of understanding that the rupee could ever attain a value considerably above that of the silver it contained, and who at the same time were unable to protect themselves against the manœuvres of dealers in silver.

It was on the 26th of June 1893, that the Government decreed the closing of the mints, and in June 1898 that the exchange reached 16 pence. It has taken five years to arrive at this.

This, I venture to say, is a very remarkable result considering the time which was absolutely indispensable to put the rupee to 60 per cent. above its intrinsic value by the natural and automatic contraction of the circulation.

Besides the famine and the plague, which have both to a considerable extent rendered the operation more difficult, one must not forget the manœuvres of speculators for the fall in Indian exchange during four consecutive years. They have ultimately been compelled to desist after having sustained severe losses. Lastly, the considerable import of silver has to a great extent delayed the gradual rise in the exchange. It has greatly contributed to make capital scarce and to maintain high rates of interest during the busy seasons. It has permitted dealers in silver to sell to the natives on unfavourable terms for the latter, silver bars against coined rupees of the increasing value of which the natives were still in ignorance. These facts would certainly have justified and would still justify an important increase of the import duty on silver, which increase would likewise help to check the illicit coinage of rupees in several frontier States.

In any case, the limit of 16 pence is now reached, the exchange has been maintained at that rate during the dead season. The chief object of the reform is therefore attained, and everything leads to the expectation that the money market will not in future be subjected to great fluctuations in exchange nor to excessive rates of interest.

The question now to be considered is that of the introduction of the gold standard.

Previous Existence of a Gold Standard in India.

In the first place it would be well to note that it is not the question of the adoption of a new system. That point has been clearly elucidated by a well known economist, Mr. H. Dunning Macleod, in a remarkable letter. A gold standard existed in India from remote times until the 1st January 1853, when the public treasuries suddenly refused to receive gold coin. It has been estimated that at that time gold coin to the value of 120,000,000*l.* were in circulation. How then can it be asserted that India is too poor a country to have a circulation of gold coin? On the contrary India is admirably adapted for a return to the gold standard.

Such being the case one has to consider the best method of obtaining its re-establishment.

Ratio to be fixed between the Sovereign and the Rupee.

All partizans of a gold standard for India are agreed, I think, as to the advisability of adopting the sovereign as the legal basis of the monetary system of the Empire. The only point wherein opinions differ is the ratio at which rupees should circulate in the country as fractional currency of the sovereign.

Some propose 1*s.* 3*d.*, *i.e.*, £1 = 16 rupees. Others, including the Indian Government, give preference to the ratio of 1*s.* 4*d.*, *i.e.*, £1 = 15 rupees. This ratio has the advantage of having been chosen as a trial basis by the Herschell Committee, and that with complete success since the exchange has attained and exceeded the rate of 16 pence, and now, during the dead season, maintains that rate, a result which the warmest supporters of the monetary reform could never have ventured to anticipate.

Other partizans of the gold standard, and I confess I am amongst the number, think that it would be more favourable for the country, for the inhabitants, for the Government and for the officials, to fix a rate more in keeping with the primitive value of the rupee (2*s.*). The rate of 1*s.* 6*d.*, *i.e.*, £1 = 13⅓ rupees, or that of 1*s.* 8*d.*, £1 = 12 rupees would not be excessive. The late Mr. Bertram Currie was of the same opinion.

In my judgment it is just as easy to-day to attain 1*s.* 6*d.*, or even 1*s.* 8*d.*, as it was to reach 1*s.* 4*d.*, perhaps easier, notwithstanding the numerous obstacles and the strong opposition which the reform encountered.

One question why the rupee should be fixed at so low a rate as compared with the sovereign when in England the sovereign is sub-divided into 20 shillings, worth in reality 10*s.* In France the 20 francs piece is likewise sub-divided into 20 francs in silver money, worth only 10 francs; finally in the United States 20 dollars in silver of an intrinsic value of 10 dollars circulate as the equivalent of 20 dollars in gold, &c., &c.

A striking example of the level attained automatically by money of which the coinage has been suspended is afforded by the Turkish medjidie. This coin which has no legal fixed ratio to gold and an intrinsic value of but 20·6 pence at the current price of silver, circulates to-day by virtue of the law of supply and demand at about 39·6 pence, that is at an appreciation of 92 per cent. (almost the value of gold).

There would, therefore, be no undue appreciation in having rupees in circulation at 18 pence, that is at 80 per cent. above their intrinsic value. It would be to the advantage of the Government and of the people, whose revenues and wages would be proportionately raised without any change being made in the bases of taxes and wages.

Let me add that the Herschell Committee, when taking the rate of 1*s.* 4*d.* as basis of the currency reform, clearly explained that the limits could be raised if necessary. This is conveyed in the 151st paragraph of the report of the committee, which is as follows:—

> "It would not, of course, be essential to the plan that the ratio should never be fixed above 1*s.* 4*d.*; circumstances might arise rendering it proper and even necessary to raise the ratio, and the Indian Government might be empowered to alter it with the sanction of the Secretary of State. Such a scheme would, indeed, in the first instance be tentative and would not impede further action if circumstances should render it desirable."

On this point I beg leave to quote the conclusions set forth in my pamphlet of the 18th March 1897 "Le Role "futur de l'or et de l'argent":—

> "The want of a single monetary basis for international relations makes itself more and more felt. Gold is the metal which best fulfils the required conditions.
>
> "It is the gold standard which is being gradually adopted by all nations.
>
> "Silver will everywhere play in a greater measure the part of fractional currency.
>
> "No matter what ratio may be chosen for the coinage of silver pieces, these coins will obtain in

the interior circulation of every country a par value with gold currency on condition of their not being in excess of the requirements of the circulation."

The most satisfactory Plan for establishing a Gold Standard.

Notwithstanding the great advantages resulting from a higher rate of exchange, it cannot be disputed that with a limit of 1*s.* 4*d.* in force there would be an end to the period of transition, which is, to some extent an impediment to commercial transactions. Whatever ratio between the sovereign and the rupee is resolved on, the principal object to be attained is an effective introduction of the gold standard.

Is a gold circulation indispensable? Should it be left to individual initiative and be brought about by the automatic movements of the commercial exchanges? Or, on the other hand, should it be effected forthwith by a Government measure introducing at first a more or less considerable quantity of gold?

I have no hesitation in asserting that a circulation of gold itself is indispensable. As to the means of attaining that end I am inclined to think that it would be preferable to bring about an influx of gold by the automatic working of trade. This would certainly require more time, but then the measure would not be jeopardized by an erroneous estimate of the initial quantity of gold to be introduced by Government.

I advocate, therefore, simply a continuation of the monetary reform, believing that the material obstacles which were present at the outset are now overcome, and that ere long sovereigns will flow into the country. Actual interference on the part of the Government should be restricted to a declaration that henceforth "the sovereign is legal tender in India." If the exchange of 1*s.* 4*d.* is ultimately adopted, the sovereign being declared legal tender at the ratio of 1 sovereign =15 rupees, transactions would be entered into on that basis.

Reply to the Arguments of the Indian Tea Planters who are in Favour of Re-opening the Mints.

The gold price of a commodity does not depend on the currency of the country where it is produced, however depreciated such currency may be. It is based on the supply and demand of such commodity. When production increases and no fresh outlets are found, prices fall, and, inversely, when the consumption develops more rapidly than production, prices rise.

The following statistics of Indian tea since 1886 clearly demonstrate that the depreciation in the price of that commodity does not arise from the fluctuations of the value of the rupee, but from the continuous increase in the production without sufficient outlets being found to absorb the excess:—

Production of Tea in India.

Year.	Production.	Land under Cultivation.	Average Price of Indian Tea per Pound.	Average Rate of Exchange in India.
	Lbs.	Acres.	*d.*	*d.*
1886	82,425,812	298,219	12	17·4
1887	92,252,082	312,803	11⅝	16·9
1888	99,792,544	324,327	10¾	16·3
1889	107,042,875	333,701	10¼	16·5
1890	112,036,000	344,807	10½	18·
1891	123,867,000	362,437	10¼	16·7
1892	121,994,000	374,869	10	15·
1893	132,247,000	395,839	9½	14·5
1894	134,713,000	422,551	9¼	13·1

No. 23.

LETTER from Mr. H. F. ASTON, Proposing INCREASE OF WEIGHT OF RUPEE.

SIR, 14 November 1898.

I HAVE the honour to forward, with due deference, for favour of submission to the Indian Currency Commission, a copy of my proposal,* advocated by me since 1875, for remedying the Indian currency difficulty by increasing the weight of the silver rupee.

2. In a despatch dated October 1876, the Government of India said: "We consider it certain that if we "should find it necessary to make any change in our "standard unit of value, it would be incumbent upon "us sooner or later and more or less quickly to call in "our old currency, and directly or indirectly at the "public expense, to substitute a new currency, repre-"senting the new standard of real value."

3. I would point out that the liability the Government would incur by issuing a new heavier rupee and recalling the present coins is measurable. Taking the effective currency at 120 crores, or 1,200 million rupees, and silver at 27½*d.* per ounce, to add a fourth to the weight of each rupee in the effective currency would cost 13,750,000*l.* for the silver *plus* the cost of minting, and would make the intrinsic value of the rupee 25 per cent. higher, that is 1*s.* 1¾*d.* instead of 11*d.* with silver at 27½*d.* per ounce.

4. Gold would flow automatically into the Indian currency (if the sovereign remains legal tender), when 15 rupees become worth more than a sovereign, and such artificial methods as closing the mint and an import tax on silver &c., would still be available for regulating the gold price of the rupee when silver fluctuates below a certain point. The great danger of excessive manufacture of counterfeit coin would disappear. There would be far less inducement to speculate in currency, and the risk of a return to India of large quantities of rupees from other countries would be avoided.

5. Failing the introduction of such a reform, I would point out with deference that it might well be taken into consideration whether a rupee should not be issued when needed for 1*s.* 4*d.* of silver instead of for 1*s.* 4*d.* of gold. There would then be room for an automatic increase of the silver currency, according to trade requirements, without reducing the cost of the rupee. The mere fact that during the recent stringency in the loanable capital market, 24 per cent. interest was demanded in India for advances on silver when the rate on gold was 16 per cent., proves how important it is that the silver assets of India should be made more liquid. Such a difference in the rate of interest on loans on gold and silver could not exist if a rupee could be obtained at the mint for 1*s.* 4*d.* of silver. It is, I think, open to grave doubt whether debtors who have incurred an obligation to pay in silver should be burdened with the duty to procure gold before rupees can be got from the mint. Trade need not be burdened with this duty. If the Government wishes to accumulate gold, then the Government can choose its time when to convert its silver into gold, but trade obligations must be punctually discharged.

I have, &c.,
H. F. ASTON.

To the Secretary,
Indian Currency Commission.

No. 24.

LETTER from the LONDON INDIAN SOCIETY.

Washington House, 72, Anerley Park, S.E.,
SIR, June 22, 1898.

IN accordance with a Resolution passed at a Conference of Indians resident in the United Kingdom, convened by the London Indian Society on 20th instant at St. Martin's Town Hall, I have the honour to submit for your and the Committee's kind consideration, the following Resolution unanimously passed at that Conference:—

RESOLUTION.

1. "That fall or rise in exchange does not in itself matter in true International trade, which

* Not printed.

adjusts itself automatically to the requirements of exchange; that closing the mints or introducing the gold standard does not and cannot save a single farthing to the Indian tax-payers in their remittances for 'home charges'; that closing the mints and thereby, raising the true rupee of about 11*d.* of gold, to a false rupee of 16*d.* of gold is a covert act of exacting 45 per cent. more taxation from the Indian tax-payers, and at the same time of increasing the salaries of officials, and other payments in India by Government to the same extent; that the introduction of gold standard will simply add more to the existing grievous burdens of the tax-payers, to the extent of the cost of the alteration; that the real cause of the terrible evils of poverty, famine, plague, false currency, &c., is what Lord Salisbury truly calls the 'bleeding' of India (or as he says 'India must be bled'), and the 'bleeding' is further increased by the fall in exchange or rise in gold; that until this most deplorable 'bleeding' of India is stopped there is little chance, if any, of saving India and the British Empire from serious disasters or destruction; and lastly, that the constitution of the present Currency Committee is utterly unsatisfactory, as the suffering Indian tax-payer is not at all represented."

Proposed by DADABHAI NAOROJI, Esq.
Seconded by Dr. SARAT MULLICK.

I have, &c.
DADABHAI NAOROJI, Chairman.

Rt. Hon. Sir H. H. Fowler, G.C.S.I.,
President of the Currency Committee,
India Office.

No. 25.

LETTERS by Mr. DADABHAI NAOROJI, submitted to the COMMITTEE through the BRITISH COMMITTEE of the INDIAN NATIONAL CONGRESS.

Washington House,
72, Anerley Park, S.E.,
July 30, 1898.

MY DEAR SIR WILLIAM WEDDERBURN,

IN accordance with the reply of the 5th instant from the Currency Committee to your letter saying "they will, however, be glad to accord their best "consideration to any written communication which "you may desire to lay before them," I send you this statement, which you would be good enough to forward to them.

2. I may add that I am willing to submit to any cross-examination that may be considered necessary to test the correctness of my views, or to ask me other questions. You know that I have been in business in the City for 25 years as a merchant, and also as a commission agent, I have dealt with almost every kind of export and import between England and India. I have seen some commercial and monetary crises, including that of "the Black Friday," when, I think, Messrs. Overend, Gurney and Co. closed their doors.

3. Fall or rise in exchange does not in itself (other circumstances remaining the same) matter in true international trade, which adjusts itself automatically to the requirements of exchange. To establish this proposition by a detailed explanation of the mode of operations of Indian trade, I attach as Appendix A. some letters which I wrote to the "Times" and the "Daily News" in 1886.*

4. Closing the mints or introducing a gold standard does not and cannot save a single farthing to the Indian taxpayers in their remittance for "Home Charges" to this country. The reason is simple. Suppose we take roundly 20,000,000*l.* sterling to be the amount of the "Home Charges." The Indian taxpayers have to send as much produce to this country as is necessary to buy 20,000,000*l.*, not an ounce less, no matter whatever may be the rupee, or whatever the standard (gold or silver) in India. England must receive 20,000,000*l.* in gold, or produce worth 20,000,000*l.* The only way in which relief can come to the Indian taxpayers in these remittances, is the rise in the prices of the Indian merchandise in this country, and not by any juggling with the currency laws of India.

5. The Government of India, in their despatch to the Secretary of State (Simla, November 9, 1878), themselves admit this in so many words:—

"66. Now, it is plain that so long as the amount of the so-called tribute is not changed, the quantity of merchandise necessary to pay it will not change either, excepting by reason of a change of its value in the foreign country to which it goes." (C. 4868, 1886, p. 25).

6. Closing of the mints, and thereby raising the true rupee, worth, at present, about 11*d.* in gold, to a false rupee to be worth 16*d.* in gold, is a covert exaction of about 45 per cent. more taxation all round from the Indian taxpayers, and at the same time of increasing the salaries of officials and other payments in India by Government to the same extent, and giving generally the advantage to creditors over debtors, the former being generally well-to-do, and the latter the poorer classes, especially in the case of the money-lenders and the ryots.

7. The real and full effect of the closing of the mints must be examined by *itself*, irrespective of the effect of other factors. First of all, the closing of the mints was illegal, dishonourable, and a despotic act. It is a violation of all taxation Acts, by which there was always a distinct contract between the Government and the taxpayers based upon the fundamental principle of sound currency, *i.e.*, of a certain definite rupee. And what is that fundamental principle upon which the currency, both of this country and of India, is based? The former is upon what is called the gold standard, and the latter the silver standard. Take this country first.

8. Here the whole currency is based upon a sovereign—a fixed unit of a certain quantity of gold, whatever its relative exchangeable value may be with all other commodities. A sovereign is nothing more or less than, or anything else but, 123.274 grains of gold of a certain fineness, with a stamp upon it, certifying to the world that it is what it professes to be, and that no restriction whatsoever was to be placed either on the market of gold or on the coining of gold. Any person may present 123.274 grains of gold of standard fineness, with the mintage (which, I think, is three halfpence on an ounce),* and ask for a sovereign, and will get it. It is not buying or selling gold; Government simply having fixed a unit of currency measure, stamps the unit that it is the proper unit. I should be surprised if Government here should even think of interfering with this unrestricted sale and coinage of gold, as the foundation of the sound currency of this country. The sovereign is the standard by which every other commodity, including silver, is measured in its exchangeable value, just as a foot is a standard measure of length, a gallon of liquid. The taxpayer's contract with the Government is that he is to pay in such unrestricted sovereigns, and every taxation law lays down the payment in such sovereigns.

9. Similarly about India—substitute 180 grains of standard silver, with 2 per cent. for mintage for a rupee, in place of 123.274 grains of gold, with three halfpence for every ounce of gold coined, for a sovereign, and all the above remarks apply word for word to the case of India, except that I should not be surprised at the Indian authorities playing any pranks, regardless of consequences to the Indian people, as long as they are considered favourable to the "interests," and are to be made at the cost of the Indians.

10. This is the true rupee—180 grains of standard silver at its market value, with nearly 4 grains more for mintage, is convertible into a rupee without any restriction either on the silver market or on the free coining of silver. It is in this true rupee that the taxpayer is legally bound to pay his taxes. Any interference with the fundamental principle and law of the rupee is illegal, immoral, or dishonourable.

11. Now comes the false rupee. The true rupee, in its relation to gold at the present market value of silver of 184 grains, is worth, say, about 11*d.* of gold. Government intervenes, abuses its power or duty to coin silver unrestrictedly, makes the rupee scarce and false, and forces it up to the value of 16*d.* of gold, or about 269 grains of silver (including mintage), which the rupee does not contain. And the taxpayer is compelled, by what Mr. Gladstone called "the

---

* Not reprinted.

* I understand that there is no charge now. (Coinage Act of 1870, Section 8).

argument and law of force," to pay his tax in this false rupee, under the false pretence of using the word "rupee" when this "rupee" is not one rupee, but nearly one-and-a-half rupee.

12. Let us now take the factor of closing the mints by *itself*. Suppose I go into the market with my produce to buy 184 grains of standard silver for which I am asked one maund of rice. I go to the mint and ask to coin this into a rupee which I have to pay to the Sircar for my tax. If I get the rupee, then it is all right. But no, the mint refuses to coin. It virtually tells me, "Bring 269 grains of silver (*i.e.*, worth 16*d.* of gold) and you will get a rupee." I go into the market to get the rupee. The man who has the rupee tells me, "If you give me 269 grains of silver, or as "much produce as would buy 269 grains of silver, I "would give you the rupee." What alternative remains for me but to give as much of my rice, about 1½ maunds, to get this false "rupee," instead of only one maund to get the true rupee which I can get in the *same market* and at the *same time?* This is altogether independent of whatever the *actual* price of commodities may be.

13. If the actual price of rice does not show this fall, owing to the disguise of the false "rupee," it is not that the closing of the mints has not produced this decline, but that other fortunate factors have influenced the price, whose benefit is robbed away from me by the Government by the covert device of the closing of the mints. Otherwise I would have received so much higher price for my produce than the actual price. The loss, therefore, to me is all the same, as I was forced to pay in my produce for 269 grains of silver to get the false "rupee" instead of at the *same moment* paying for 184 grains of silver to get the true rupee. These two different prices in merchandise for the false and the true rupee are demanded, as I have said above, at the *same time*, and in the same market, *i.e.*, the price of the false rupee, 45 per cent. higher than that of the true rupee, entirely irrespective of any general market rise or fall of price at any same time. If the actual price of the rice be 1½ maunds for the false rupee, the price at the *same time* will be one maund for the true rupee, or for 184 grains of silver.

14. To test this in another way. Let us take some commodity in the country itself upon which the factor of the closing of the mints produces its full effect in the actual market, and which is not materially affected by other commercial factors, which operate generally upon the general merchandise. Such a commodity in India is gold. It is affected, not in merely foreign exchange or international relations, but in *India itself* as a commodity, like every other commodity. Say I have a sovereign, and I want to sell it for rupees in India itself—not for exchange to foreign parts. If the "rupee" were the honest, true rupee of the market value of 184 grains of silver, I should get 22 such rupees for my sovereign, but at the false value of the "rupee," *i.e.*, the market value of 269 grains of silver, I actually get only 15 "rupees." This is the actual price of gold in India, a decline in the proportion of the false inflation of the false "rupee." This is the case with every commodity, as can be tested by offering produce for the true rupee of 184 grains of silver, and for the false rupee or 269 grains of silver at the *same time* and in the *same market.*

15. In addition to the higher taxation thus inflicted on the Indian taxpayers, by an irony of fate, the very "interests" (bankers, merchants, planters, foreign capitalists of all kinds, &c.) for whose behalf, besides that of Government itself, all this dislocation of currency was made, are now loudest in their cry for all the mischief caused also to them, and yet the authorities in both countries remain blind and infatuated enough not to learn even by experience, and persist in a mischievous course.

16. In the Treasury letter of 24th November 1879 (c. 4868, 1886, page 31) to the India Office, my Lords say:—

"1. The proposal appears to be open to those objections to a token currency which have long been recognized by all civilized nations, viz.:—That instead of being automatic, it must be 'managed' by the Government, and that any such management not only fails to keep a token currency at par, but exposes the Government which undertakes it to very serious difficulties and temptations.

17. "2. It appears to my Lords, that the Government of India, in making the present proposal, lay themselves open to the same criticisms as are made upon Governments which have depreciated their currencies. In general, the object of such Governments has been to diminish the amount they have to pay to their creditors. In the present case, the object of the Indian Government appears to be to *increase the amount they have to receive from their taxpayers.* My Lords fail to see any real difference in the character of the two transactions.

18. " . . . . If, on the other hand, it is the case that the value of the rupee has fallen in India, and that it will be raised in India by the operation of the proposed plan, that plan is open to the objection that *it alters every contract and every fixed payment* in India.

19. "This proposal is, in fact, contrary to the essential and well-established principle of the currency law of this country, which regards the current standard coin as a piece of a given metal of a certain weight and fineness, and which condemns as futile and mischievous every attempt to go behind this simple definition.

20. "It is perfectly true as stated in the despatch (paragraph 41), that the "very essence of all laws re-"lating to the currency has been to give fixity to the "standard of value as far as it is possible," but it is no less true that, according to the principles which govern our currency system, the best and surest way, and, indeed, the only tried and known way, of giving this fixity is to adhere to the above definition of current standard coin. A pound is a given quantity of gold, a rupee is a given quantity of silver; and any attempt to give those terms a different meaning is condemned by experience and authority.

21. "3. If the present state of exchange be due to the depreciation of silver, the Government scheme, if it succeeds, may relieve:—

"(1.) The Indian Government from the inconvenience of a nominal re-adjustment of taxation in order to meet the loss by exchange on the home remittances.

"(2.) Civil servants and other Englishmen who are serving or working in India, and who desire to remit money to England.

"(3.) Englishmen who have money placed or invested in India which they wish to remit to England. *But this relief will be given at the expense of the Indian taxpayer*, and with the effect of increasing every debt or fixed payment in India, including debts due by *ryots to money-lenders;* while its effect will be materially qualified, so far as the Government are concerned, by *the enhancement of the public obligations in India, which have been contracted on a silver basis.* . . . .

22. "If, then, a case has been made out, which my Lords do not admit, for an alteration of the currency law of India, the particular alteration which the Government of India propose, could not, in the opinion of the Treasury, be entertained until the doubts and objections which have suggested themselves to my Lords are answered and removed. These objections are founded on principles which have been long and ably discussed, and which are now generally admitted by Statesmen, and by writers of accepted authority, to lie at the root of the currency system.

23. "It is no light matter to accept innovations which must sap and undermine that system, and my Lords have, therefore, felt it their duty plainly—though they hope not inconsistently with the respect due to the Government of India—to express their conviction that the plan which had been referred to them for their observations is one which *ought not to be sanctioned* by Her Majesty's Government or by the Secretary of State." [Italics are mine.]

24. Can condemnation be more complete and convincing?

25. The introduction of a gold standard, while it will not save a single farthing, or a single ounce of produce to the Indian taxpayer in his payment of "Home Charges," as already explained, will simply add more to his already existing grievous burdens to the extent of the heavy cost of the alteration, and injure him, Heaven knows, in what other ways, as the events of the past five years have shown.

26. The whole basis of the action of the Government is, and was, the assumption that, as fall in exchange will necessitate increased burden of taxation, the closing of the mints and introduction of a gold standard will save the Indian taxpayer from any such additional burden of taxation which would otherwise arise enor-

mously in the remittance of "Home Charges," and that it is imperatively necessary to establish a stable ratio between gold and silver. That the anxiety of the Government about increased burdens of taxation and its political dangers, and that to save the people from the former and the Government from the latter were the professed motives of all the present currency laws, would be clear from Government's own despatches.

27. In order not to encumber the statement here with the extracts from those despatches, I give them as Appendix B.

28. Both these objects, viz., saving people from additional taxation, and thereby Government from political danger, by the present proposals and past currency legislation, are pure delusions. The Government might as well have tried to stop the action of gravitation as to try against a natural law, that while gold and silver should fluctuate in value in relation to and like all other commodities, yet between themselves they could be made to keep up a fixed ratio, or to try to make a rupee, which may be only worth 11*d.* or even 6*d.* of gold, become worth 16*d.* of gold, unless Government have found the philosopher's stone, or have attained the divine power of creating something out of nothing.

29. It is not that the Government of India did not know this, or were not told this from the highest authority and others, and in distinct and emphatic terms. Of this I have already given (see *supra* 16 to 23 paras.) extracts from the despatch of the Treasury of November 24, 1879.

30. Notwithstanding the clear and emphatic views of the Treasury, expressing "their conviction that the "plan which had been referred to them for their obser- "vations is one which *ought not to be sanctioned by Her "Majesty's Government or by the Secretary of State,*" the Government of India and the India Office again opened the subject in another form.

31. Lord Randolph Churchill wrote to the Treasury on January 26, 1886, and forwarded on March 17, 1886, a letter from the Government of India, dated February 2, 1886 (c. 4868, 1886, pp. 3–5). To avoid repetition I would not take extracts from these letters, as the reply of the Treasury embodies their views.

32. This reply of the Treasury is dated May 31, 1886 (signed Henry H. Fowler):—"6. As a result of this re- "view of the inconveniences caused by the depression "in the value of silver, the Government of India express "their opinion . . . . Yet there remains one thing "which is not beyond the possibility of human control, "and that is 'the establishment of a fixed ratio between "'gold and silver.' The proposition thus stated as an "undoubted axiom is, however, one of the most dis- "putable and disputed points in economic science. My "Lords may, in passing, compare with this statement "the declaration recorded by Mr. Goschen, Mr. Gibbs, "and Sir Thomas Seccombe, as the representatives "of Her Majesty's Government at the International "Monetary Conference of 1878, that 'the establish- "'ment of a fixed ratio between gold and silver was "'utterly impracticable.'"

33. "The Indian Government further express their belief (paragraph 7) that it is possible to 'secure a stable ratio between gold and silver,' and that 'a serious responsibility will rest both on the Government of India and on Her Majesty's Government if they neglect any legitimate means to bring about this result.' It would, however, have been more satisfactory if the Indian Government had undertaken to explain the grounds of their confidence that a stable ratio between gold and silver can be established, and the methods by which this is to be accomplished." . . .

34. "8. In December, 1878, Lord Cranbrook, then Secretary of State for India, forwarded to the then Chancellor of the Exchequer (Sir Stafford Northcote), without any expression of opinion, two despatches from the Government of India, containing certain proposed remedies for the evils arising out of the depression in the value of silver which were then in full force. In the only one of those despatches to which reference need here be made, after *unfavourable* reference to previous suggestions—(1) that a gold standard and gold currency should be introduced into India; and (2) that the weight of silver in the rupee should be increased, it was proposed to limit the free coinage of silver at the Indian mints. The intention of this change was to introduce into India a gold standard, while retaining its native silver currency, the ratio between the currency unit (the rupee) and the standard (the sovereign) being fixed arbitrarily by the Government. The means for attaining this end are worked out in the despatch with great elaboration of detail." (Italics are mine.)

35. "9. This despatch and its proposals were submitted by Lord Cranbrook, on behalf of the Indian Government, and Sir Stafford Northcote, as Chancellor of the Exchequer, to a Committee consisting of Sir Louis Mallet, Mr. Edward Stanhope, M.P., Sir Thomas Seccombe, Mr. (now Sir Thomas) Farrer, Mr. (now Sir Reginald) Welby, Mr. Giffen, and Mr. Arthur Balfour, M.P. These gentlemen reported, on the 30th April, 1879—'That having examined the proposals contained in the despatch, they were unanimously of opinion that they could not recommend them for the sanction of Her Majesty's Government.'

36. "10. Subsequently, on the 24th November, 1879, the Treasury replied in detail to the proposals of the Indian Government. In the first part of that letter, which summarises the case as stated in the despatch, I am to call the particular attention of the Secretary of State to the following passages, which seem to apply with equal force to the present situation:—

37. "'My Lords need not point out that a change of the Currency Laws is one of the most difficult tasks which a Government can undertake, and that it is most unadvisable to legislate hastily and under the influence of the pressure of the moment, or of an apprehension of uncertain consequences, upon a subject so complicated in itself and so important to every individual of the community, in its bearing upon the transactions and obligations of daily life.

38. "'It is not proved that increase or re-adjustment of taxation must necessarily be the consequence of matters remaining as they are, for nothing is said about reduction of expenditure, and equilibrium between income and expenditure may be regained by economy of expenditure as well as by increase of taxation. Further, the cost of increase of salaries may be met or at least reduced by a careful revision of establishments. . . .

39. "'A perusal of the despatch leads to the conclusion that the Government of India are especially anxious to put an end to the competition of silver against their own bills as a means of remittance to India. But my Lords must ask whether this would be more than a transfer of their own burden to other shoulders; if so, who would eventually bear the loss, and what would be the effect on the credit of the Government and on the commerce of India.'"

40. The letter then further quotes the paragraphs, which I have already given before, pointing out that the relief wished for by the Government "will be given at the expense of the Indian taxpayer."—(*Supra*, para. 21.)

41. "The Treasury find no reason stated in the despatch of the Government of India in the present year, which induces them to dissent from the conclusions thus sent forth on the authority of Sir Stafford Northcote as to the results of any attempt artificially to enhance the gold price of silver. . . .

42. "'13. . . . It has been the policy of this country to emancipate commercial transactions as far as possible from legal control, and to impose no unnecessary restrictions upon the interchange of commodities. To fix the relative value of gold and silver by law would be to enter upon a course directly at variance with this principle, and would be regarded as an arbitrary interference with a natural law, not justified by any present necessity.

43. ". . . . The observation of the Treasury in 1879, 'that nothing is said about reduction of expenditure,' seems to apply still more strongly to the existing situation, and it may be safely concluded that the control of its expenditure is far more within the reach of a Government than is the regulation of the market value of the precious metals" (c. 4868, 1886, p. 12).

44. Before proceeding further, I may in passing point out that in 1876 the Government of India itself was against their present proposals, and, as my Lords of the Treasury say, they have urged no sound reasons to alter those views. I have not got the Government of India's despatch of 1876, but I quote from that of November 9, 1878 (c. 4868, 1886, p. 18).

45. "3. The despatch above referred to (October 13, 1876) discussed in some detail . . . . The general

result, however, was to point out that the adoption of a gold standard with a gold currency that should replace the existing silver would be so costly as to be impracticable, and would otherwise be open to objection; . . . .

46. "4. The despatch notices also, *but only to reject it*, the proposal that the Indian standard of value, and with it the exchange value of the rupee, might be raised by limiting the coining of silver in the future, and by adopting a gold standard without a gold currency." (The italics are mine.)

47. The Government of India, in their reply of February 9, 1877, to a resolution of the Bengal Chamber of Commerce passed by them on July 15, 1876, said:—

"8. The value of no substance can serve as a standard measure of value unless its use as the material of legal tender currency is freely admitted. If, therefore, the free coinage of silver on fixed conditions were disallowed in India, silver would no longer be the standard of value of India, but another standard would be substituted, namely, the monopoly value of the existing stock of rupees tempered by any additions made to it by the Government or illicitly. If no such additions were made, the value of the rupee will gradually but surely rise."

48. "9. The stamp of a properly regulated mint, such as the Indian Mints, adds nothing except the cost of manufacture and seignorage to the value of the metal on which it is impressed, but only certifies to its weight and purity."

49. "10. A sound system of currency must be automatic or self-regulating. No civilised Government can undertake to determine from time to time by how much the legal-tender currency should be increased or decreased, nor would it be justified in leaving the community without a fixed metallic standard of value even for a short time. It is a mistake to suppose that any European nation has rejected silver as a standard of value without substituting gold." (c. 7060, 1893, p. 337. Petition of the Indian Association to the House of Commons.)

50. And yet the Government forgot its "civilisation" and its "sound system," and inflicted upon poor India the penalty of its folly by the troubles of the past five years, and what is worse still, they want to persist in the same mischief.

51. Reverting to the above replies of the Treasury. After such complete condemnation by the Treasury of the proposals of the Government of India, the Indian authorities fought shy of the Treasury, and, after inditing a meaningless despatch to keep up appearances, left the Treasury severely alone, as far as I know, and adopted their own usual means to have their own way to rush into their own foregone, crude, and thoughtless legislation. The only wonder is that the Committee of 1893, while knowing all this, and seeing all the pitfalls and serious consequences of the proposals, allowed the Indian Government to have their own way, in the face of the emphatic rejection by the Treasury of these proposals.

52. To me, the proceedings of the Indian authorities is nothing surprising. Whenever they make up their mind to do a thing they would do it—be the opposition what it may—be it of Parliament itself. Resolutions or statutes of Parliament, or condemnation by the Treasury, are to them nothing. The usual process in such cases is to appoint a Commission or a Committee, put in Members and have witnesses of their own choice, leaving, if possible, just a small margin for appearance of independence. Generally, they get their own foregone conclusions. If by some happy chance the Commission decided anything against their view, so much the worse for the Commission. The Report is pigeonholed, never to see the light of day, or to ignore such part as is not agreeable. If thwarted (as in this instance by the Treasury), the Government keep quiet for a time, wait for more favourable opportunities, and are at it again, taking better care against another mishap.

53. Thus they took their own usual course, which has, as was clearly predicted at the time, launched us on the present sea of troubles.

54. What is stranger still, is that after the Treasury so distinctly condemned these proposals, they did not care to see that any contemplated rash and crude legislation was not inflicted on the Indian taxpayers. The fact seems to be that India is the vile body upon which any quacks may perform any vivisection, and try any cruel, crude, or rash experiments. What matters what is done to it? The Treasury, *i.e.*, the English taxpayer, has not to suffer in any way. India is our helot, she can be forced to pay everything. But they forget Lord Salisbury's *eternal* words—"Injustice "will bring down the mightiest to ruin."

55. The next natural question is—Why is it, that fall in exchange should cause grievous troubles to India and not to any other self-governing, silver-using country? What is the real disease which creates all the never-ceasing pains of India? The reply is given by Lord Salisbury in four words, "India must be bled" under a system of "political hypocrisy." As long as this is the fate of India under an un-British system of government, no jugglery, no loud professions of benevolence, no device of raising a rupee to what it is not worth, will cure India's sad fate and "terrible misery." (Lord Salisbury's words).

56. I shall let the authorities themselves speak about the real cause of India's troubles. Lord Salisbury's view I have given above. The following extracts explain this view more explicitly, and how it is effected. First, Lord Salisbury has explained that "the injury "is exaggerated in the case of India, where so "much of the revenue is exported without a direct "equivalent."

57. And the literature of this very controversy itself supplied a clear explanation. Lord Randolph Churchill, as Secretary of State for India, explains how the "bleeding" and the drain of revenue is effected, and indicates also the final retribution—just as Lord Salisbury does, as already quoted by me. Lord Randolph Churchill, in his despatch to the Treasury of January 26, 1886 (c. 4,868) 1886, page 4, says:—first—

58. "It need hardly be said that it is in consequence of the large *obligatory payments* which the Government of India has to make in England in gold currency that the fall in the exchange value of the rupee affects the public finances." (Italics are mine).

59. And next he hits the nail on the head, and gives concisely and unmistakeably the real evil from which all India's woes flow.

60. He says:—"The position of India in relation to "taxation and the sources of the public revenues is "very peculiar, not merely from the habits of the "people, and their strong aversion to change, which "is more specially exhibited to new forms of taxation, "but likewise *from the character of the Government, "which is in the hands of foreigners who hold all the "principal administrative offices and form so large a "part of the army.* The impatience of new taxation, "which would have to be borne *wholly as a consequence "of the foreign rule imposed on the country, and virtually "to meet additions to charges arising outside of the "country*, would constitute a *political danger*, the real "magnitude of which, it is to be feared, is not at all "appreciated by persons who have no knowledge of, "or concern in, the government of India, but which "those responsible for that government have long "regarded as of the most serious order." (The italics are mine.)

61. Here, then, is the real disease—*the character of the Government, which is in the hands of foreigners*, who hold all the principal administrative offices, and form so large a part of the army—"the taxation which would "have to be borne *wholly as a consequence of the "foreign rule* imposed on the country, and virtually to "meet additions to charges arising outside of the "country."

62. And it is remarkable that this was prophesied more than a hundred years ago by the highest Indian authority of the day.

Sir John Shore, in his famous minute in 1787 (Parliamentary Return 377 of 1812, para. 132), says:—

63. "Whatever allowance we may make for the increased industry of the subjects of the State, owing to the enhanced demand for the produce of it (supposing the demand to be enhanced), there is reason to conclude that the benefits are more than counterbalanced by *evils inseparable from the system of a remote foreign dominion.*" (The italics are mine).

64. These *evils of the system of a remote foreign dominion* must be faced by the British rulers before it is "too late." No jugglery of currency, or loud pro-

fessions of benevolence, or the hundred and one subterfuges to which Indian authorities resort, will ever cure these evils—or put British rule on a solid and safe foundation and relieve the Indian people of all these national, political, and moral degradations and debasement, and economic and material destruction. Give India true *British* rule in place of the present *un-British* rule, and both England and India will be blessed and prosperous.

65. Now, with regard to the immediate position—What is to be done now? Retrace the false step of 1893, taken in spite of the clear warnings of the Treasury and others, and against the "law of Nature." The opening of the mints to the unrestricted coining of silver will correct all the mischievous results that have flowed from the closing of the mints. And further, the true remedy, as pointed out by the Treasury, is a reduction of expenditure and readjustment of establishments.

66. It never occurs to the Indian authorities in both countries that the high salaries of officials may be reduced, say a third, and as repeatedly urged by many a right-thinking man, native agency should be substituted—except for the highest control—for the foreign agency, and that Britain should contribute its fair share of the expenditure, to the extent to which such expenditure is incurred for *its own purposes* and *benefits*, such as the European services and Imperial wars, &c. Of course, anybody can understand that it is hard for officials to cut their own salaries, and let the Indians to come by their own or ask the British people to contribute a fair share. But this is the only remedy both for the preservation of English rule and for the prosperity of both England and India.

67. The opening of the mints will have immediate important effects. (1.) The stringency of the money market and the consequent dislocation of trade will be remedied. (2.) The poor taxpayer will have to submit to such additional taxation only (after careful and earnest reduction of expenditure and avoiding of suicidal and unnecessary wars) as will be absolutely necessary to meet the deficit caused by the natural fall of exchange, instead of a concealed enormous enhancement of the *whole* taxation of the country, under the disguise and by the creation of a false "rupee," by closing the mints, to the extent of the difference between the value of the true and false rupee (may be between 6*d.* and 16*d.*, or nearly three times as much).

The Indian authorities must take the advice which the Treasury has given and restore the currency law to its original purity and soundness.

68. The second proposal for a gold standard (with partial or full quantity of gold) must be abandoned. The Government of India have themselves condemned the proposal, as already stated, paragraph 45. What does it mean? It is most inopportune at present. It means that all the proportionate small quantity of silver that is in British India, and the proportionately large quantity that is in the native States, must be forcibly (not by any natural economic cause but by the despotism of the State) deprived of a large portion of its present value by throwing a large quantity of it in the market, and buy a large quantity of gold at a still higher proportion of value by the large additional demand created by it. All this loss in cheapening silver, and dearer gold to be squeezed out of the poor, wretched, famished ryot of India.

69. The conversion of silver into gold standard cannot be carried out without great cost (see paragraph 45), which will be the highest cruelty and tyranny to inflict upon the "bloodless" and miserable and helpless people of India, and especially this infliction to be made on the false assumption that it will give relief from the burden of the remittances for "Home Charges," when it will do nothing of the kind, as stated by Government itself.

70. The step is not at all necessary for any economic purpose, except that it will be a convenience to the foreign exploiter, official and non-official. A gold currency, without gold (paragraph 46) and with an unrestricted silver currency, is a delusion rejected by Government itself, and forcibly impressed by the Treasury.

71. I do sincerely hope and trust that this and all such heartlessness towards, and un-British treatment of, the wretched people of India will become a thing of the past, and a true *British* rule may bring blessing and prosperity to both Britain and India.

72. I beg to give in Appendix C. a statement of December 11, 1892, which I have submitted to the Currency Committee in 1892, from which it will be seen that I had then pointed out the objections to the proposals. I also beg to refer the Committee to my evidence before the same Committee on December 17, 1892. (C. 7060, II.), 1893, page 106.

73. There are several other more or less minor questions. Suppose a ryot is paying Rs. 10, what will be taken from him in gold? Will it be at the rate at which the intrinsic value of the silver is at the time (at present 11*d.*, may be 6*d.*) or will demand be made at the present false value of 1*s.* 4*d.*, or even in the despotic power, at the rate of 2*s.*, *i.e.*, 1*l.* of the Rs. 10?

74. When gold currency is introduced, what salary will be paid to the officials at 11*d.* or 6*d.* of whatever the market value of the rupee may be, or at 16*d.*, or even 24*d.*, of the despotic value of the "rupee," for every rupee of the salary—a rupee of 180 grains of silver. In other words, will it be 25*l.* at 6*d.*, or about 46*l.* at 11*d.*, or about 66*l.* at 16*d.*, or 100*l.* at 24*d.* for a present salary of Rs. 1,000 of a rupee of 180 grains?

75. There is the foreign merchant or capitalist of every kind always wanting to save himself in his trade-risks at the cost of the taxpayer, besides using to no small extent, or to the extent of the deposits of revenue in the banks, the revenues of the taxpayers, as his capital for his trade, and besides what is brought back to India, out of the "bleeding" of India as his, the foreign capitalist's, capital. Is Government going to inflict oppression upon the Indian taxpayer whenever these "interests" raise a cry and agitation for their selfish ends? Merchants and all sorts of foreign capitalistic exploiters and speculators must be left to themselves. It is no business of the State to interfere in their behalf at the cost of the Indian taxpayers; they know their business; they are able, and ought to be left to take care of themselves. They exploit the country with the Indians' revenue and "bleeding." That is bad enough in all conscience—the profits are theirs, and the losses must be also theirs, and not an additional infliction upon the Indian taxpayers.

76. The Government here dare not play such pranks with the taxpayers. In India the Government only thinks of the foreign "interests" (official and non-official) first, and of the subjects afterwards, if it ever thinks of the subjects at all when foreign "interests" are concerned.

77. Lord Mayo has truly said: "I have only one "object in all I do. I believe we have not done our "duty to the people of the land. Millions have been "spent on the conquering race, which might have "been spent in enriching and in elevating the children "of the soil. We have done much, but we can do a "great deal more. It is, however, impossible, unless "we spend less on the 'interests' and more on the "people."

78. On another occasion he said: "We must take "into account the inhabitants of the country—the "welfare of the people of India is our primary object. "If we are not here for their good, we ought not to be "here at all." ("The Hindu," of 4th May 1898. Sir W. Hunter's "Life of Mayo.")

79. This is exactly the whole truth. It is the "interests" alone that the present selfish system and spirit of Government care for—and though that is some profit to England, it is most destructive to India. If, according to the noble words of Lord Mayo, the *people's* true welfare were made the object, England itself will be vastly more benefited than it is at present, and India will also be benefited and will bless the name of England, instead of cursing it as she now begins to do—shut your eyes to it as much as you like. Do as Lord Mayo says, and all difficulties of trade, taxation, finances, currency, famine, plague, unnecessary wars, and last, but not least, of *poverty* and *disaffection* will vanish. The past has been bad, "bleeding, and degrading"—let the future be good yet—prospering and elevating. India then will be quite able to pay as much as may be necessary for healthy government, and *all necessary* progress.

80. In the above remarkable and true words of Lord Mayo, you have the cause of all India's woes and evils, and all England's political dangers of "the most serious order," as well as the proper remedy for them,

Will this Currency Committee rise to its duty and patriotism?

Yours truly,
DADABHAI NAOROJI.

Sir William Wedderburn,
Chairman of the British Committee of
The Indian National Congress,
84, Palace Chambers, Westminster, S.W.

APPENDIX A.

INDIAN EXCHANGES.

Correspondence in the "Times" of September 9th, 13th, 16th, 20th, and 27th, 1886, and the "Daily News," September 24th and 28th, 1886, not reprinted.

APPENDIX B.

Extracts from Parliamentary Papers, C. 4868, 1886, and C. 7098, 1893, not reprinted.

APPENDIX C.

"INDIA," July 1, 1893.—THE CURRENCY QUESTION.

Statement submitted by Mr. Dadabhai Naoroji to the Currency Committee.

The questions of exchange and currency in connexion with India have, unlike those questions in other countries, two different branches, and it is very important to keep them distinctly in mind.

(1.) Political. (2.) Commercial.

(1.) The political aspect entails upon British India the compulsory remittance of about 16,000,000*l.* to this country every year (which will now be 19,000,000*l.*, as no more railway capital will be forthcoming to be used here instead of drawing on India). I am not discussing here the righteousness or otherwise of this state of affairs. It is the loss caused by the fall in exchange in the remittances of these (now) 19,000,000*l.* which is the point under consideration. Otherwise the question of exchange would have no significance, as I have shown in my letters to the "Times" in September, 1886.

The proposal to introduce a gold currency into India is based on the argument that it would save all present loss to the people of India from the fall in exchange. It will do nothing of the kind. It will simply inflict greater loss and hardship on the wretched Indian taxpayer. I explain.

The Indian taxpayer, at the time when exchange was 2*s.* per rupee, was sending produce to England worth 16 crores of rupees to meet the payment of 16,000,000*l.* Now, taking exchange, say roundly 1*s.* per rupee, he has to send produce worth 38 crores of rupees to meet the (present) remittance of 19,000,000*l.*—or at a double rate. To avoid the confusion of ideas that prevails through the present controversy, I would eliminate silver altogether from the problem and put it in another form—that, when one rupee was equal to 2*s.*, the Indian taxpayer sent, say, one million tons of produce to meet the 19,000,000*l.* of Home Charges—when a rupee is 1*s.*, he has to send two million tons of produce to meet the same demand. Whether the currency be gold or silver or copper or lead will not be of the slightest consequence. The Indian taxpayer will have to send to this country as much produce, and not one ounce less, as would purchase 19,000,000*l.*—the only difference in the quantity of produce to be sent will depend solely on the rise or fall in gold. Only there will be on the poor taxpayer this additional infliction—that he will be saddled with the heavy cost of the conversion of the currency in gold; and gold becoming so much more in demand will still further rise, and the taxpayer will have to send so much more produce to meet the additional rise in the value of gold. All talk of saving to the Indian the present loss by fall in exchange is pure imagination.

Again, suppose a ryot is paying Rs. 10 as land tax. When gold currency is introduced, what will Government take from him in place of Rs. 10? Will Government demand at the supposed rate of 1*s.* per rupee—*i.e.*, ten shillings only—or will Government demand arbitrarily in its despotic power at the rate of the fictitious value of a rupee as two shillings and will take 1*l.*, or any amount at any higher rate above the intrinsic value of the rupee? Taking the gross revenue comprehensively, the total gross revenue is Rs. 850,000,000, what will Government take from the taxpayer when gold currency is introduced? Will it take at the present supposed rate of 1*s.* per rupee, viz., 42,500,000*l.*, or will it arbitrarily impose a double revenue at the rate of 2*s.* per rupee, so that from his present poor produce the taxpayer must sell double the produce to meet the demands of Government.? If the latter, what a precious benefit will this be to the Indian taxpayer from the gold currency!

When gold currency is introduced, what salary will be paid to the European official? Suppose he has a salary of Rs. 1,000 per month, will Government give him at the rate of 1*s.* per rupee, *i.e.*, 50*l.*, and will the official accept 50*l.* for the Rs. 1,000? Is not all the present strong agitation of the Anglo-Indian a clear reply that he will do nothing of the kind, but will continue his agitation till he gets 100*l.* or something near it for his Rs. 1,000; or in other words get his salary doubled at a stroke, at the expense of the starving ryot? And has not Government already shown that it will yield to such agitation, and will be readily "liberal" to European demands at the sacrifice of the Indians? It has already yielded to the demands of the uncovenanted Europeans, and has given them a fixed exchange of 1*s.* 9*d.* per rupee for their furlough, no matter whether exchange is 1*s.* or even less, say 6*d.* Now the whole European service is agitating to get them 1*s.* 9*d.* or some other high fixed exchange, even to the extent of half their salary. Do these Anglo-Indians really want to exact from the starving ryot such high exchange when the rupee is worth perhaps a shilling or even sixpence? Who will pay this difference? Of course an arbitrary Government may oppress a people as much as they like, but will the British people and Parliament allow such a thing?

On the top of all this comes the merchant with his agitation for the gold currency, that he may be saved, at the sacrifice of the ryot, from his risks of trade. The profits of trade are for his pocket, but risks of a commercial disturbance must be met by the ryot! The poverty-stricken ryot must protect the well-to-do-trader! God save India!

I do not need to trouble the Committee with any further remarks as to the effect of the introduction of a gold currency on the condition of the people, who according to Lord Lawrence's testimony, are living on scanty subsistence, and who, according to Lord Cromer, are already "extremely poor." Our friends the Anglo-Indians have to bear in mind that they are taking already from the mouths of the poor Indian about Rs. 150,000.000 or more every year as salaries, allowances, pensions, &c., to the so-much deprivation of the provision of the children of the soil. Will they never understand or consider this, and what evil that means to India?

A word about the proposal to stop free coinage of silver. Now we know that a trade, internal or external, especially internal, requires abundant currency in a country like India; the curtailment of the coinage of the rupee will dislocate and cripple the free action of the trade of the country, especially internally, and will inflict serious injury and create some new complications. Secondly, the rupee, being thus artificially raised to a fictitious value by being made scarce, will depress the price of produce, and the ryot will be obliged to part with more of his poor produce to meet the demands of Government. Will this be a benefit to him? Further, by this restriction on coinage the wretched Indian taxpayer will not be relieved of a single ounce of produce in his forced remittances for the Home charges of 19,000,000*l.*—in gold. Whatever the exchangeable value of gold is in relation to produce will have to be paid by the poor ryot, be the forced artificial exchange or the fictitious value of rupee what it may. By restricting the coinage of silver—the price of silver in relation to produce being artificially enhanced—the taxpayer will have to pay the salary of all

the European and other officials in such higher priced rupee, with so much more produce to part with; which, in short, will in effect be a far heavier burden, by increasing the *whole* salary of the officials of all the services, both Indians and Europeans, at so much the greater sacrifice of the wretched ryot.

The agitation for stopping coinage of silver or introducing gold currency, far from relieving the Indian taxpayer from the present loss by fall in exchange, which in all conscience is very heavy indeed, will actually inflict greater injury upon the helpless fellows. All attempts at artificial tampering with currency will, besides injuring the people, recoil upon the perpetrators of the mischief. They can no more raise the value of silver fictitiously than they can suspend gravitation.

The evil of the present loss from exchange does not arise from the fall in exchange, but from the unfortunate, unnatural political and economic condition of British India. Were there no compulsory remittances to this country (any ordinary *free* transactions of business or loans between two countries not mattering beyond the usual risks of business), there would be no evil or embarrassing loss to Government such as we are considering. The excessive European services are the cause of all such calamity upon the Indians. Any other silver-using country—for instance, China—has no problem like that which at present embarrasses the British Indian Government.

(2.) Coming to the second branch of the question, viz., the effect of the fall in exchange on international trade (for it is in such trade or business only that exchange is concerned), the best thing I can do is to give below the letter I wrote to the "Times" in September 1886, and some other letters (I have inserted those letters, which I need not repeat here.) Of the letters to the "Times," that paper was pleased to write approvingly in one of its leaders.* Further, I have made, in the statement, some remarks as to the action of the United States in endeavouring futilely to stop the silver storm, instead of allowing it to run its course. This I need not give here.

The step which the Government has now taken will, I am afraid, produce much mischief, and inflict great injury on the taxpayer, crushingly heavy loaded as he already is. The utmost that the Government might have done would have been, as I was afraid they were determined to do, to give some fixed exchange to the officials for their remittances to this country—to as much as half the salary. This would have been bad enough, but the course the Government have adopted, and for which there was no great necessity, will, I fear, prove far more injurious.

Washington House,
72, Anerley Park, S.E.,
DEAR SIR WILLIAM, 20 October 1898.

SINCE my letter of 28th July last, I have perused the blue book of the evidence given before the Currency Committee, and I feel it necessary to make a further statement.

"*British India.*"

2. These words are often used in a very misleading and confusing manner. I give below an extract from a statement which I have submitted to "the Royal Commission on Indian Expenditure and Apportionment of Charges," which I hope will place the matter in a clearer light.

3. "Before I proceed further, let me clear up a strange confusion of ideas about prosperous British India and poverty-stricken British India. This confusion of ideas arises from this circumstance. My remarks are for British India only.

4. "In reality there are two Indias—one the prosperous, the other poverty-stricken.

"(1) The prosperous India is the India of the British and other foreigners. They exploit India as officials, non-officials, capitalists, in a variety of ways, and carry away enormous wealth to their own country. To them India is, of course, rich and prosperous. The more they can carry away, the richer and more prosperous India is to them. These British and other foreigners cannot understand and realise why India can be called "extremely poor," when they can make their life careers; they can draw so much wealth from it and enrich their own country. It seldom occurs to them, if at all, what all that means to the Indians themselves.

"(2) The second India is the India of the Indians—the poverty-stricken India. This India 'bled' and exploited in every way of their wealth, of their services, of their land, labour, and all resources by the foreigners, helpless and voiceless, governed by the arbitrary law and argument of force, and with injustice and unrighteousness—this India of the Indians becomes the 'poorest' country in the world, after one hundred and fifty years of British rule, to the disgrace of the British name. The greater the drain, the greater the impoverishment, resulting in all the scourges of war, famine and pestilence. Lord Salisbury's words face us at every turn, 'Injustice will bring down the mightiest to ruin.' If this distinction of the 'prosperous India' of the slave-holders and the 'poverty-stricken India' of the slaves be carefully borne in mind, a great deal of the controversy on this point will be saved. Britain can, by a righteous system, make both Indias prosperous. The great pity is that the Indian authorities do not or would not see it. They are blinded by selfishness—to find careers for 'our boys.'" (Letter to Lord Welby, dated 31st January 1897).

5. This state of affairs arises from the evil system of an un-British foreign dominion as predicted by Sir John Shore in 1787. This evil makes the action of the British trader and capitalist an exploitation, which otherwise, under ordinary circumstances under true British system, would be legitimate trade and investment.

6. Almost throughout the blue book, the thing chiefly considered is the requirements and benefits of the "foreign prosperous British India." "Indians' India" chiefly comes in only for the consideration as to how to tax the Indians in order to meet the requirements and benefits of the British official bleeders and non-official exploiters. Earnestly and repeatedly are questions put and answers given—how additional taxation should be raised—*not how to probe the evil and to find the true remedy.*

7. The main scope and direction of the evidence is as if India were a country and property of the Anglo-Indians and British traders and capitalists; as if, therefore, their wants and requirements, and the means of enabling them to carry away as much wealth as they possibly can to England, were the chief object; and as if to consider the land, resources, and labour of India as only the instruments for the above purpose.

"*Indebtedness of India.*"

8. This expression is repeatedly brought out for the self-satisfaction and justification of the exploitation. Let us examine how this particular phenomenon is brought about.

9. The process is this: The total amount of "Home Charges" is 15,795,836*l.* (Stat. Abstract for 1896–7, p. 106) [C. 9036], 1898. Out of this, I deduct fully—railways 5,790,567*l.*, and stores department 951,700*l.* In deducting these two items I do not mean that I admit the necessity of doing so entirely, but that I want to avoid any controversy at this stage upon what are called "Public Works Loans," made by England, and Government stores. The remainder, after making the above deductions, is 9,053,569*l.* = R. 199,178,518, at 1*l.d.* per rupee, about R. 22 per 1*l.*, about which is the present legitimate rate for the true rupee, and which, with much more, though under disguise, the Indian taxpayer is actually forced to pay. Taking roughly R. 200,000,000, every pie of it is drawn from the people of British India, and becomes an addition to the capital or wealth of England, and is altogether spent in England, every year.

10. Next, the European services are paid in India every year (at R. 1,000 and upwards per annum, not including lower salaries), about R. 94,679,627 (including a small amount of pensions paid to Eurasians,

* The "Times," January 26, 1889:—"We observe with pleasure that Lord Cross says nothing on the bounty alleged to be enjoyed by the Indian wheat grower through the fall in the value of silver. This piece of nonsense has been again and again exposed in the letters of our correspondents, and never more clearly and forcibly than by Mr. Dadabhai Naoroji"

not separately given) (Parl. Ret. 192 of 1892). I do not know whether this amount includes the payments made for and to European soldiers in India. I think not. If so, this has to be added to the above amount. To it has also to be added, I think, the illegal exchange compensation, which is allowed to Europeans, thereby out-Shylocking Shylock himself by not only taking the pound of flesh, but an ounce of blood also. Almost the whole of this amount of R. 94,679,627—say roughly, R. 95,000,000—plus soldiers' payments and exchange compensation, is a loss to the people of British India, excepting in a way a small portion which goes to domestic servants, house-owners, &c. But these amounts would have gone all the same to these domestics, &c., even though Indians had been in the place of the Europeans. The services rendered by such domestics, &c., being consumed by others than the children of the soil are so far a loss to the country.

11. But I do not propose to argue this point here. I allow for the present this expenditure in British India by the European officials as not forming a part of the loss by the drain. I think it is generally claimed by the Anglo-Indians that such expenditure in India by European officials is about, on an average, half of the salaries and emoluments paid to them in India, and that the other half is about the amount which is remitted to England for families and of savings. Taking, therefore, this half of R. 94,679,627 = R. 47,339,813, and adding this amount to R. 200,000,000 (para. 9), the total is roughly R. 250,000,000 every year—probably more, if the two additions mentioned above of European soldiers' payments and exchange compensations were made. This enormous amount of annual political drain causes what Sir George Wingate very properly calls a "cruel and crushing tribute." Never could India have suffered such a cruel fate in all its history or existence.

12. The first step, therefore, towards the so-called "indebtedness" is, that British India is "bled" every year to the amount of about R. 250,000,000 clean out of the country, and this enormous wealth is year after year poured into England. Will the India Office be good enough to make a return of the enormous wealth which England has drained out of India during its whole connexion?

13. Now, the second stage in the process of the manufacture of "indebtedness," is that out of this enormous wealth, drawn away from India—(sufficient, and far more than sufficient, to build thousands of miles of railways and every possible public works, and to meet every possible requirement of good government and progress to the highest prosperity and civilization) —out of this enormous drain, a small portion is taken back to India as "British capital," when it is nothing of the kind, and by means of the so-called "British capital," all Indian resources of land and labour are further exploited by "British"(?) capitalists of every kind. All the profits made thereon are so much more wealth drawn away from India and brought to England.

14. Further, the foreign exploiters are not satisfied with the small portion of Indian wealth which they take back to India as their own capital, but they insist upon being further helped from the very current revenues of the country. So voracious are these exploiters, that they clamour against Government for not putting its whole revenue at their disposal in the Presidency Banks instead of keeping a portion in the Treasury. Thus, there is, at first, a political bleeding, which is the foundation evil, and in its train and by its help comes the so-called "commercial" or capitalistic exploitation.

15. Thus is manufactured that complacent "indebtedness," in the name of which, the bleeding and exploitation are unceasingly and ever-increasingly carried on, and which is so pleasant, so profitable, and so nice an excuse to the Anglo-Indian and British capitalists' heart.

16. In reality, there is not a single farthing of indebtedness from India to England. It is England that is under a very vast material and moral debt to India. Of the latter (moral) debt, I cannot speak much here, though it is no less enormous and grievous than the former.

17. Besides the sum of R. 400,000,000 now drained from India (para. 24) every year (1) the British Indian Empire is built up at the *entire* expense of India and mainly with Indian blood. Even now, Indian blood is contributing in extending the British Empire and benefits in other parts of the world. And what a reward—a helotry! (2.) Not only this, but in addition to the cost of building up the whole Indian Empire, England has taken away from India an amount of wealth since its connexion with India, which, with ordinary commercial compound interest, will amount to thousands and thousands of millions sterling.

18. It may be asked whether I mean that I do not want British capitalists to go and trade or employ their capital in India? I mean nothing of the kind. By all means let them do so. Under ordinary circumstances, India will hail it as any other country may do. But let it be with *their own* capital. Let them bring their own capital and make upon it as much profit as they can with India's blessing upon it. What I mean is, that they should not first plunder "India, leaving it "wretched and helpless; then bring back a portion of "the plundered" India's wealth as their own, exploit therewith India's resources of land and labour, carry away the profits, and leave the Indians mere hewers of wood and drawers of water—mere slaves in worse plight than even that in which the slaves of the Southern States of America were.

19. If England can understand her true interests—political, moral, economic, or material: if she would hold back her hand from India's throat, and let India enjoy its *own* resources, England can make India prosperous, and, as a necessary consequence, can derive from India far, far greater benefit, with India's blessing, than what she derives at present with India's curse of the scourges of war, pestilence, and famine, and of an ever-increasing poverty.

20. The word "indebtedness" must be taken at its correct interpretation. It is simply "bleeding" and exploitation, or what Mr. Bright indirectly characterised "plunder."

"Balance of Trade in India's favour, and excess of Exports over Imports as a Benefit to India."

21. What is balance of trade in its true sense? Say a country exports 100,000,000*l.* worth of its produce. It gets back in imports, say, 80,000,000*l.* worth of other countries' merchandise. The remaining balance of 20,000,000*l.* of the original exports, and, say, 10 per cent. of profits, or 10.000.000*l.*, altogether 30,000,000*l.* has *to be received*. This 30,000,000*l.* is called balance of trade in favour of that country. And when that country actually receives this balance of 30,000,000*l.*, either in the shape of bullion or merchandise, then its account is said to be squared or settled.

22. I have not included in this trade account any true borrowing or lending. Such borrowing or lending can be considered by itself. A country's borrowing is included in its imports, and the interest it pays is a part of its exports. This loan account between any two independent countries can be estimated and allowed for, and that in no way affects the *bonâ fide* balance of trade. If India be allowed to, and can, *get* its true balance of trade, it would be only too happy to make any legitimate borrowing or lending with any country with benefit to both.

23. But such is *not* India's condition. What is India's actual condition? What is its so-called "balance of trade," of which much mistaken or wrong view is taken in the evidence. Be it first remembered, as I have already explained under the heading of "indebtedness," that what is called India's debt is nothing of the kind, but simply and solely part of its own wealth taken away from it.

24. Let us see what the amount is. (C. 9036, 1898, p. 277.) Taking the last five years as an illustration, the total net exports for 1892–3 to 1896–7 are R.1,314,600,000. The total exports for the same period are R.5,688,000,000. Taking 10 per cent. profits thereon will be R.568,800,000. Therefore the total excess of net exports plus profits would be R.1,883,400,000. Then again, the so-called "loans" from this country are included in imports, the net exports must be increased to that extent. The addition to commercial debt in this country after 1891–2 to 1896–7 is 6,479,000*l.* (C. 9036, 1898, p. 130), or say 6,500,000*l.*, which, at the average rate of exchange of the same years (p. 131) about 1*s.* 2*d.* per rupee, or nearly R.17 per 1*l.*, is equal to R.110,500,000. So that the total of net exports (excluding loans from imports) and profits will be R.1,883,400,000 + 110.500.000. equal to R.1,993,900,000, or about, roundly, R.2,000,000,000. During the five

years the average per year will be about R.400,000,000. Now, to call this as "balance of trade in favour of India" is the grossest abuse of language. It is neither "trade" nor "balance of trade." It is simply and solely *remittances* of the official bleeding, and the exploitation of the non-official capitalists. Not a *pie* of this tremendous amount—R.400,000,000 every year—will India ever see back as its *own*, while in true "balance of trade" the whole of this amount should go back to India as its *own*.

25. No wonder Sir William Harcourt's heart rejoiced at the leaps and bounds with which the income-tax increased year after year in this country. In his speech on the occasion of his famous Budget he rejoiced at the increasing income-tax, never seeming to dream how much of it was drawn from the "bleeding" drain from India.

26. With what self-satisfied benevolence have examiners and witnesses talked of the great benefit they were conferring upon India by making every effort to increase the excess of exports in order to enable poor India to meet her "indebtedness." Such is the Indian myth. But what is the reality? To increase the net exports as much as possible means to increase the remittances of the bleeding and exploitation of every year of which not a farthing is to return to India as its own. Extraordinary, how ingeniously matters can be, and are, represented or rather misrepresented, and the public here entirely misled.

"Surpluses" and "Solvency."

27. There never have been and never will be true surpluses or solvency of British India, as long as the present evil system of Government lasts. What is a surplus of the finances of any country? Suppose that in England you raise 100,000,000*l.* of revenue. Suppose 95,000,000*l.* are spent and 5,000,000*l.* remain in hand at the end of the year; and this 5,000,000*l.* is called surplus, and that the Government, if it does not impose any additional taxation or does not borrow, is solvent. Now, the essential condition of this surplus is that the whole of the 95,000,000*l.* has returned to the taxpaying people themselves in a variety of ways and continues to be the part and parcel of the wealth of the country and the remaining 5,000,000*l.* will also go back to the people and remain a part of the wealth of the country.

28. But what is the case with India? It is nothing of the kind. Suppose R.1,000,000,000 are raised as revenue. Suppose R.950,000,000 are spent, leaving R.50,000,000 in hand at the end of the year. Now, are these R.50,000,000 a surplus? No, the R.950,000,000 have not all returned to the people and have not remained as part of India's own wealth. Some R.250,000,000 (*see* paragraph 12) are drained clean out of the country by foreigners, never to return to India. Till these R.250,000,000 are returned to India as its own, which they never are, and which is a dead loss, to talk of a surplus of R.50,000,000 is another gross abuse of language. Instead of R.50,000,000 surplus, there is a pure deficit or rather entire loss of R.250,000,000. And such perpetual losses are pure bankruptcy.

29. I repeat that there never has been and never will be any surplus in India, as long as from every year's revenue, there is a clean drain, which at present is at the rate of about R.250,000,000. In this country all that is raised as revenue returns to the country, just as all water evaporating from the ocean returns to the ocean. And England's ocean of wealth remains as full as ever, as far as revenue is concerned. India's ocean on the contrary must go on evaporating and drying every year more and more.

30. The only reason why the Indian Government does not go into bankruptcy—bankrupt though it always is—is that it can by its despotism squeeze out more and more from the helpless taxpayer without mercy or without any let or hindrance. And if at any time it feels fear at the possible exasperation of the people at the enormity, it quietly borrows and adds to the permanent burden of the people, without the slightest compunction or concern. Of course, the Government of India can never become bankrupt till retribution comes and the whole ends in disaster.

31. I have referred in the above consideration to the official bleeding only. But when to this is added the further exploitation of the land (meaning all the resources) and labour of the country, which I have already described, the idea of surplus or solvency, or of any addition to the wealth or prosperity of the *people* (however much it may be of the Europeans), becomes supremely ridiculous and absurd.

Import of Bullion and Hoarding.

32. Reference is frequently made to this matter. I think the best thing I can do is to give an extract from my reply to Sir Grant Duff in "Westminster Review" of November 1887,

33. "Sir Grant Duff refers to the absorption of gold and silver and to hoarding. What are the facts about British India?—In my "Poverty of India" I have treated the subject at some length. The total amount (after deducting the exports from imports) retained by India during a period of eighty-four years (1801 to 1884), including the exceptionally large imports during the American war, is 455,761,385*l.* This is for *all* India. The population at present is 254,000,000. I may take the average of eighty-four years roughly—say 200,000,000. This gives 45*s.* 6*d.* per head for the whole eighty-four years, or 6½*d.* per head per annum. Even if I took the average population as 180,000,000, the amount per head for the eighty-four years would be 50*s.*, or 7*d.* per head per annum. Of the United Kingdom I cannot get returns before 1858. The total amount of treasure retained by the United Kingdom (after deducting exports from imports) is, for twenty-seven years, from 1858 to 1884, 86,194,937*l.* Taking an average of 31,000,000 of population for twenty-seven years, the amount retained for these twenty-seven years is 55*s.* 7*d.* per head, or very nearly 2*s.* 1*d.* per head per annum; while in India for more than three times the same period the amount is only 45*s.* 6*d.* per head, or 6½*d.* per head per annum. France has retained from 1861 to 1880 ("Mulhall's Dictionary") 208,000,000*l.*, and taking the population—say 37,000,000—that gives 112*s.* per head in twenty years, or 5*s.* 7*d.* per head per annum."

34. "Sir Grant Duff ought to consider that the large amount of bullion is to be distributed over a vast country and a vast population, nearly equal to five-sixths of the population of the whole of Europe; and when the whole population is considered, what a wretched amount is this of gold and silver—viz., 6½*d.* per head per annum—received for all possible wants! India does not produce any gold or silver. To compare it with Europe—Europe retained in ten years, 1871–1880 (Mulhall, "Progress of the World," 1880), 327,000,000*l.* for an average population of about 300,000,000, or 21*s.* 10*d.* per head, or 2*s.* 2*d.* per head per annum. India during the same ten years retained 65,774,252*l.* for an average population of say 245,000,000; so that the whole amount retained for the ten years is about 5*s.* 4*d.*, or only 6½*d.* per head per annum, against 21*s.* 10*d.* and 2*s.* 2*d.* respectively of Europe. This means that India retained only one-fourth of what Europe retained per head per annum during these 10 years. It must be further remembered that there is no such vast system of cheques, clearing-houses, &c., in India, as plays so important a part in England and other countries of Europe. Wretched as the provision of 6½*d.* per head per annum is for *all* wants—political, social, commercial, &c.—there is something far worse behind for British India. All the gold and silver that I have shown above as retained by India is not for British India only, but for the Native States, the frontier territories, and the European population; and then the remainder is for the native population of British India. We must have official information about these four divisions before we can form a correct estimate of what British India retains. The Native States, as I have said before, have no foreign drain except the small amount of tribute of about 700,000*l.* Some frontier territories *receive* something instead of paying any tribute. These States, therefore, receive back for the exports of their merchandise, and for the ordinary trade profits on such exports, full returns in imports of merchandise and treasure, and this treasure taken away by the Native States and frontier territories forms not a small portion of what is imported into India. It must also be considered how much metal is necessary every year for waste of coin and metal, and for the wants of circulating currency. When Government can give us all such information, it will be found that precious little remains for British India beyond what it is compelled to import for its absolute wants. I hope England does not mean to say that Englishmen or English women may sport as much as they like in ornaments or personal trinkets or jewellery, but that the wretch of a native of British India, their fellow-subject, has no business or right to

put a few shillings' worth of trinkets on his wife or daughter's person—or that natives must simply live the lives of brutes, subsist on their 'scanty subsistence' (Lord Lawrence) and thank their stars that they have that much."

35. "I will now try to give some indication of what bullion British India actually retains. Mr. Harrison gave his evidence before the Parliamentary Committee of 1871–74, that about 1,000,000*l.* of fresh coinage was more than sufficient to supply the waste of coin or metal. Is it too much to assume that in the very widespread and minute distribution, over a vast surface and a vast population, of small trinkets or ornaments of silver, and their rough use, another million may be required to supply waste and loss? If only a pennyworth per head per annum be so wanted, it would make a million sterling. Next, how much goes to the Native States and the frontier territories? Here are a few significant official figures as an indication: The 'Report of the external land trade and railway borne 'trade of the Bombay Presidency for 1884–85' (p. 2), says of Rajputana and Central India:—'13. The im-'ports from the external blocks being greater than the 'exports to them, the balance of trade due by the 'Presidency to the other provinces amounts to 'Rs. 12,01,05,912, as appears from the above table 'and the following.' I take the Native States from the table referred to.

"*Excess of Imports in Bombay Presidency.*"

	Rs.
"From Rajputana and Central India -	5,55,46,753
„ Berar - - - -	1,48,91,355
„ Hyderabad - - -	8,67,688
Total - -	7,13,05,796"

Or 7,130,579*l.*, This means that these Native States have exported so much more merchandise than they have imported. Thereupon the Report remarks thus:—'The greatest balance is in favour of Rajputana and 'Central India, caused by the import of opium from 'that block. Next to it is that of the Central Pro-'vinces. It is presumed that these balances are paid 'back *mainly in cash*' (the *italics* are mine). This, then, is the way the treasure goes; and poor British India gets all the abuse—insult added to injury. Its candle burns not only at both ends, but at all parts.

36. Far from any important quantity or any quantity of bullion going to British-India as "balance of trade," Rs. 400,000,000 worth of British-India's wealth at present goes clean out of the country every year never to return to it as its own.

Benefits derived from cheap silver—A low rupee and low exchange promotes and develops exports.

37. That there is some temporary advantage from low exchange to silver-using countries over gold-using countries, I have already explained in my letter to the "Daily News" of 24 September 1886 (App. A. of my letter already submitted). But in British India this little advantage is not of much avail to the poor people. What becomes of it when they must perforce lose every year, never to return to them, Rs. 400,000,000 of wealth out of their miserable total produce leaving them so much more poor and miserable. It is idle to talk of the people of British India deriving benefit from low exchange or from anything as long as these tremendous bleeding and exploitation go on.

Prices and Wages.

38. The above remarks apply equally to prices and wages. How on earth under such a drain can there be any healthy increase of prices or wages arising from true prosperity? Before the Royal Commission on Indian Expenditure and Apportionment, a member having asserted that there was general rise of prices, Mr. Jacob, as official witness, confirmed the statement. Thereupon, I prepared some questions, took the paper to Mr. Jacob and gave it to him to enable him to prepare the replies. And what was my surprise when he told me that the subject was not of his department and he would not answer the questions though he did not hesitate to say that there was a general rise of prices!

If of any use I shall produce the questions before the Committee. But first of all there are no reliable statistics sufficient to draw any correct conclusions, and conclusions of any value cannot be drawn about any one factor from prices or wages which are the results of many factors.

39. I would not lengthen this statement by noting several other points in the Blue Book, but conclude by repeating what Sir John Shore has said more than a hundred years ago (in 1787). His words were true then, are true to this day, and will remain true in future if the evil pointed out by him continues. He said:—

"Whatever allowance we may make for the increased industry of the subjects of the State, owing to the enhanced demand for the produce of it (supposing the demand to be enhanced), there is reason to conclude that the benefits are more than counterbalanced by the evils inseparable from the system of a remote foreign dominion."

40. This evil system must be altered, or as I have said before (par. 5) what under natural circumstances would in any country be legitimate trade and investment by British people, becomes, under this evil system of an un-British rule, cruel exploitation. Unless this evil is remedied, there is no hope for British India, and disaster both for England and India is the only look-out.

41. Let England pay fairly and honestly her share of expenditure incurred for her own interests, and end the bleeding by a careful consideration of the following words of the Duke of Devonshire, as Secretary of State for India, spoken in 1883:—

"There can, in my opinion, be very little doubt that "India is insufficiently governed . . . If the "country is to be better governed, that can only be "done by the employment of the best and most "intelligent of the Natives in the service." And the best means of attaining this object is to give honourable fulfilment to the resolution passed by the House of Commons in June 1893, about simultaneous examinations.

42. Unless Acts and Resolutions of Parliament and Royal Proclamations are honourably fulfilled, and a righteous government, worthy of the English character and promises and professions, is established, no currency or financial jugglery, or "political hypocrisy," or any "subterfuges," or un-British despotic ruling, will avail or remedy the ever-growing and various evils that *must* constantly flow from an unrighteous system.

43. Lord Salisbury's eternal words stare us in the face: "Injustice will bring down the mightiest to ruin."

Yours truly,
DADABHAI NAOROJI.

Sir William Wedderburn, M.P.,
Chairman of the British Committee of
The Indian National Congress,
84, Palace Chambers, Westminster, S.W.

No. 26.

LETTER from the BRITISH COMMITTEE of the INDIAN NATIONAL CONGRESS communicating Resolution adopted by the INDIAN NATIONAL CONGRESS at MADRAS in December 1898.

British Committee of the
Indian National Congress,
84 & 85, Palace Chambers,
Westminster, S.W.,
27th February, 1899.

SIR,

IN accordance with the resolution of the Indian National Congress, I have the honour to communicate the following Resolution, unanimously adopted by the Congress at Madras in December last, for the favourable consideration of the Indian Currrency Committee:—

Resolved—

(*a.*) That having regard to the fact that the principal cause of the loss by exchange is the steady growth in the demands on India for expenditure in England, this Congress is of opinion that any artificial device for meeting that loss, either by changing the currency at a heavy loss, or contracting the internal currency,

must add to the pressure on India's monetary resources and to her trading disadvantage;

(*b.*) That the only real relief lies in carrying out practically the principle, affirmed by competent authorities, of England bearing an equitable share of that expenditure;

(*c.*) That the Congress regrets, that, save Mr. Romesh Chunder Dutt, and Mr. Merwanji Rastamji, competent and qualified Indian representatives have not yet been invited as witnesses to represent the Indian view of matters on the subject which now engages the attention of the Currency Committee of which Sir Henry Fowler is the President;

(*d.*) That the President be authorized to request Sir W. Wedderburn, Chairman of the British Committee, to communicate this Resolution to Sir Henry Fowler, Chairman of the Currency Committee in London.

Proposed by Mr. D. E. Wacha, Bombay.
Seconded by Mr. G. Subramania Iyer, Madras.

In order to show the considerations which appear to have influenced the Congress in passing this Resolution I beg at the same time to forward a report of the speeches made by the mover and seconder.*

I have the honour to be,
Sir,
Your obedient Servant,
W. WEDDERBURN.

The Right Hon.
Sir H. H. Fowler, M.P., Chairman,
Indian Currency Committee.

No. 27.

SPEECH of Mr. DINSHA EDULJI WACHA at the FOURTEENTH INDIAN NATIONAL CONGRESS, held at MADRAS on 29th, 30th, and 31st December 1898.

(*Received through the British Committee of the Indian National Congress.*)

Mr. President, Ladies and Gentlemen—The Resolution which has been entrusted to me runs as follows:

(*a.*) That, having regard to the fact that the principal cause of the loss by exchange is the steady growth in the demands on India for expenditure in England, this Congress is of opinion that any artificial device for meeting that loss either by changing the currency at a heavy cost or contracting the internal currency must add to the pressure on India's monetary resources and to her trading disadvantage.

(*b.*) That the only real relief lies in carrying out practically the principle affirmed by competent authorities of England bearing an equitable share of that expenditure.

(*c.*) That the Congress regrets that, save Mr. Romesh Chunder Dutt and Mr. Merwanji Rastamji, competent and qualified Indian representatives have not yet been invited as witnesses to represent the Indian view of matters on the subject which now engages the attention of the Currency Committee of which Sir Henry Fowler is the President.

(*d.*) That the President be authorised to request Sir W. Wedderburn, Chairman of the British Congress Committee, to communicate this Resolution to Sir Henry Fowler, Chairman of the Currency Committee in London.

From the Resolution that I have just read out to you, it will, no doubt, be readily understood how important is this subject of currency at the present moment, and how far-reaching is it in its effects, intimately bound up as it is with the whole economic situation of a country so vast as India. When you reflect on the fact that the welfare of the people of a country greatly depends on its economic conditions, of which currency is one of the most potent, you will, I dare say, readily admit the influence such a condition exerts not only on the material prosperity of the population as a whole, but on that of each unit composing it. You may, therefore, easily realise what it is to alter the established currency of a country like India with its three hundred millions of people. Practically, its effects have influence on each unit of those millions. They affect you and they affect me. (Hear, hear.) But, though each individual feels their influence, he is not able to probe the cause or causes to the root. Highly technical as this subject of currency is, it is obvious that the difficulty of apprehending it lies in its manifold aspects. But technical though it be, I hope not to tire your patience while I am descanting on it, or make you go to sleep. I cannot say that I will keep you quite enlivened as our friend Mr. Khaparde (cheers) did yesterday by his humorous speech in connexion with the retrogressive policy of our rulers in the matter of Local Self-government. Currency, in the first place, is rather too serious a subject to be trifled with, and, in the second place, it will not lend itself to humour.

I shall at the outset recall to your mind, as briefly as possible, the history of the currency legislation during the last five years, and then survey the situation as revealed by the evidence recorded before the Committee of which Sir Henry Fowler is the President. Ladies and Gentlemen, from the very day that the new currency nostrum, officially known as the Amended Coinage Act of 1893, was enacted as law within half an hour by the Legislature at Simla, without any of the representatives of the people being summoned for the occasion, it has often occurred to me that the Government of India and the Services were entirely going wrong on this question. We have among us a native proverb, at least, on my side of India, that when the stomach is in disorder it is the head that is complained of. While the stomach is aching the head is needlessly accused. (Laughter.) Precisely in the same way, the disease, Ladies and Gentlemen, is not currency at all, but the Home Charges. It is misleading for the Government and its high officials to aver that it is the instability of exchange which has disturbed the finances for many a year past; and that the great divergence between the value of gold and silver is the cause of that instability. In their opinion, that cause could only be removed by altering the currency. Everything would, under that circumstance, go right. The financial embarrassments would be a thing of the past and prosperity would return to the State. But the authorities entirely ignored the fact that exchange would never be a disturbing factor were the gold obligations of the Government non-existent. Exchange was only the result of those obligations. The obligations themselves are the primary cause, the fountain and origin, of the great evils to be relieved from which they loudly insist upon a change of currency. You all know, what is a patent fact, that these gold obligations have now mounted up to nearly 17 millions sterling. (Hear, hear.) There has been for years past a steady growth in the demands made on India by the Home Government for expenditure incurred in England. But before I dilate on this question of the Home Charges which alone, I repeat, are at the root of the present financial difficulty, and not currency, I trust you will bear with me for a few moments while I endeavour to recall to your mind the history of the Currency legislation since 26th June 1893.

It was on that fateful day that the older Currency Act, which for many a year past had worked most smoothly, most automatically, and to the greatest welfare of the people, was superseded by an amended one whereby the mints were entirely closed to the free coinage of silver. All the economic evils from which the people at large and the banking and mercantile communities have suffered, and are suffering, since that event owe their origin to that measure which has often been characterised, and, in my opinion, justly characterised, as "the crime of 26th June 1893." (Hear, hear.) As I observed at one of the previous Congresses, that legislation was purely the offspring of panic. We have had more than one piece of panic legislation, of a most mischievous and obnoxious character (hear, hear) since that date; but this particular enactment was the result of the economic panic which had seized the Government of India, and of which it seems it has not yet ridden itself. Without caring to carefully diagnose the true complaint, the Government jumped to the conclusion that it was the great disparity between silver and gold which created all the financial disturbance. It, therefore, straightway forged a new Currency Act and passed it in half an hour, with merely the semblance of a debate, while there was not a single representative of the people to explain the popular view of that measure. Had there been such representatives, they might have informed the Legislature of the immense mischief that enactment was certain to create, and the dislocation of the trade it would bring in its train. How the great staple manufactures and industries suffered; how exports contracted; how confidence was shaken, and how suspense and anxiety for months prevailed, are now

* For Mr. Wacha's speech, *see* No. 27. Mr. Iyer's speech was received too late for inclusion in this Appendix.

all matters of history. The Government, frightened merely by the rumour of what the Treasury of the United States might do in connexion with the Sherman Act, thought that silver would depreciate further, and that exchange would rule lower than even a shilling, bringing about an appalling deficit! However, the unwise and ill-considered step was taken, in spite of the protest of the whole country save the Selfish Services and the interested members of the Gold Defence Association, led by Sir James Mackay. The principal object of the measure was to induce a stable ratio, such as would remain steady somewhere at 16 pence. But it was soon discovered that no such stability could be imparted, and no such rate could be maintained. It was fondly entertained by the currency prodigies at head-quarters that the immediate effect of the closure of the mints would be a diminution on the imports of silver. But to their intense disappointment that hope was not realised. The very first trouble which exercised their mind was the continued importation of the metal. The average in the four years following was only half a crore below the normal average of the 35 years previous, namely, 7 crores. This important fact proved the failure of the measure. Exchange ruled as under after the date of the closure :—

At 14·5	pence in	1893–4.
,, 13·10	,,	1894–5.
,, 13·63	,,	1895–6.
,, 14·48	,,	1896–7.

Silver could not be shut out. In my opinion it never could be shut out, however stringent and prohibitive legislation might be. As you all know, India is the sink of silver. From times immemorial it has absorbed the white metal, and will continue to absorb it, though it may for a time be artificially shut out. It has been found to be the most suitable metal for all economic as well as domestic purposes. It is a fundamental oxiom of economists that currency should not be of a material which is not suitable and convenient to the people. Only the other day, Sir R. Giffen, in his able criticism on the Government of India's proposal, in the *Economic Journal* for October last, emphasised that fundamental proposition. Lord Rothschild has been of the same opinion. Hence, to shut out silver from India, is simply a hopeless task. It will be purely Sisyphean in its character. The sooner, therefore, the currency quacks cure themselves of this craze to boycot silver from this ancient country the better. (Hear, hear.)

But when they found that silver could not be shut out, and that exchange, in spite of the closure of the mints, went downward and downward till at one moment it almost reached 1*s.*, they thought of another panacea, equally futile. The next measure was the Gold Bill, which Sir James Westland thought would stimulate the inflow of gold. But, as the fates would have it, no sooner was this precious measure, the offspring of that great financial paragon (laughter) passed into law, than it became abortive—a dead letter on the Statute Book. It was pronounced to be an abortion from the very first. And the thing had to be quietly buried without shedding one tear over it, for not many ounces of gold were offered at the treasuries, and the bankers laughed heartily in their sleeves at that impotent attempt to prop up exchange. (Hear, hear.) Meanwhile, there intervened the troubles of the famine first, and of the pestilence later on. Expeditions, again, beyond the natural boundaries of the country, were organised on the flimsiest of flimsy pretexts. The combined influences of these events were most embarrassing to the finances. Whilst they were in the midst of these physical and economic troubles, a ray of hope was offered by two great Western States. France and the United States suggested a proposal for the re-opening of the mints under certain conditions. One of those conditions was that the ratio should be maintained at 15½. That, of course, was out of the question. But the question of the ratio alone should not have caused the contemptuous rejection of the proposal as a whole, calculated as it was to bring about some definite solution of the silver difficulty. By hook or by crook, the Indian Government had worked itself into a frame of mind which could not accept anything which went to rehabilitate silver. Gold and gold alone was determined upon as the panacea for the state of affairs which their own economic policy of years had ultimately induced. Thus, the Government gave a *non possumus* to the proposal. In my personal opinion it was an excellent one which, had it been well considered and adopted after reasonable modifications, might have by this time fairly solved our difficulties. That was another grave blunder in matters of currency. Even such an apologist of the Government of India as the *Pioneer*, pointed out the error and expostulated on its summary rejection. That it was a huge blunder was further confirmed by Lord Rothschild in his evidence the other day before the Currency Committee. (Hear, hear.) This was the third stage of the Governmental failure to induce stability in exchange.

Meanwhile the aggressive border expedition, the famine, and the pestilence combined to exhaust the cash balances. They went down considerably below the normal figure, causing severe stringency in the monetary market against which the entire Indian and Anglo-Indian community raised a cry. While this was the prevalent condition of affairs, the master mind of Sir James Westland was busy manufacturing another nostrum to relieve the country of its so-called currency embarrassments. He conceived, what he thought was a most happy and practical idea, of entirely divorcing the Rupee from the bullion, whereby the value of the former could be artificially raised beyond its intrinsic worth and at the same time the gold standard passed under the amended Coinage Act of 1893 could be forced by gradually melting down the reserve Rupees in the Treasury. That so preposterous a scheme, fraught with economic evils of greater magnitude than those wrought by the previous measure, should have at all been proposed passes comprehension! No sooner was it officially given out than it raised an emphatic protest from all quarters. There was not a single apologist of that measure to bless it. Its absurdity and mischievous effect, if passed, were seen through. It became the subject of the most hostile criticism in the press, and in the banking and the commercial circles. (Hear, hear.) But Sir James thought he was, at the close of his financial career, achieving a most wonderful miracle in currency—a miracle which would enable the Indian Government to roll in wealth in future, expunge that official and canting phrase "low exchange" from future financial statements, and assist him to retire in a blaze of glory. (Laughter.) Little did he think of the storm that would rage round that pet measure, and little did he know how much unrest and dissatisfaction the very pronouncement of it would create in all parts of the country. The divorce of the Rupee from silver has already appreciated that coin beyond its intrinsic worth. It is now valued at about 45 per cent. higher, so that practically the Rupee *is not the honest Rupee* which the Legislature has defined. Its value bears no proportion to the standard weight. It is something else. The evils of this dishonest Rupee are patent to you all and I need not dilate on them. None has better described them than Mr. David Yule at the meeting of the Calcutta Bank some weeks ago. But this is the preposterous proposal of the Finance Minister which is now the subject of investigation by that packed Committee of which Sir Henry Fowler is the Chairman. We need not anticipate the conclusions of that Committee, though it should not create any surprise if it registers the decision to which the Indian Government has already arrived. (Hear, hear.) But, I repeat, preposterous as this proposal is, and calculated as it is to create greater evils in the near future, it is the duty of this Congress to enter its emphatic protest against this latest currency nostrum as against any other panacea which may have for its object an alteration of the currency which, as I have said, is all right—a currency against which the people have never complained, a currency which in the opinion of all sound experts is the most suitable and convenient to the people of India, and every way beneficial to their material progress. (Hear, hear.)

This, ladies and gentlemen, brings me to my next point, which is the kernel of the Resolution I read to you. I have already remarked that the Indian Government has all through gone on the wrong track, that that there is nothing the matter with currency. What is wrong is *the policy* of the Government which for well-nigh a century past has gone on steadily increasing the expenditure in England on account of India. We are at present reaching almost the culminating point. The evils of the Home charges are accumulating and accumulating till at last they are about to bring the Government and the people face to face with them. It has been noisily said these last 10 years that exchange is the sole disturbing factor of Indian finances; that unless the exchange difficulty is solved there can be no relief; and that the only way to obtain relief is to alter the currency. Gold is the metal of Europe. India's external trade is principally with the gold using

countries. That, therefore, gold should be adopted. It is forgotten that after all it is not the mere external trade, chiefly in the hands of foreigners, that has to be looked to. We have to look to the larger and more extensive internal trade, so closely connected with the economic condition of the cultivator and the other producers who really are the backbone of the external trade. (Hear, hear.) Looked at from that point of view, the proposal for a gold currency falls to the ground. For consider how you may, you cannot help admitting the fact that bearing in mind the poverty of the people, and their immemorial habits and usages, gold can never become the currency. Silver alone is suitable and convenient. It is the natural currency. And therefore the natural alone should be adopted; for everything artificial and unnatural must sooner or later come to grief. The ryots and other producers have already grievously suffered by the artificiality; and it would be a graver crime than that of 26th June 1893 to propose a gold currency which nobody wants, save the selfish Services and a few interested foreigners.

Now let us examine this question of exchange which is said to be the *deus ex machinâ* of all the troubles. What is this exchange? It is simply this. That by reason of a mistaken policy the Indian Government has incurred many a State obligation in gold while collecting all its revenue in silver. That it discharges railway interest and pensions to civil and military officers in gold, and that beyond these it purchases stores and other articles in England which have to be paid for in gold. That so far these "Home charges," as the expenditure above referred to is called, are steadily growing. And with such growing expenditure exchange thereon grows apace. The sterling liabilities—a portion of which, it is notorious, are unjustly foisted on India, as was made clear before the Welby Commission, by both official and Indian unofficial witnesses,—have steadily grown from 12½ millions, which was the average of the five years ending with 1876, to 17 millions or thereabouts. And no expenditure in recent times has grown faster than the military. It is the appalling growth of the military expenditure since 1885, when owing to the revival of the external policy of aggression under Lord Dufferin there was an addition to the strength of the existing army by way of 10,000 European and 20,000 native troops, which has mainly to answer for the embarrassed finances, and next the repeated border expeditions which have entailed something like 12 crores within 12 years. (Hear, hear.)

But to come to the sterling obligations: Practically, these have increased to the extent of about 4½ millions, while silver is depreciating in its gold value since 1873. It has often been proclaimed from the platform of the Finance Minister in Calcutta that every million charge of sterling correspondingly entails a greater loss in exchange. That every fall of a penny adds over a crore to the burden of that item. If this be the economic fact, was it wise on the part of the Government of India to have gone on adding to its sterling obligations from time to time, while silver, measured by the value of gold, was steadily declining? Common sense would have suggested one of three alternatives: Either a cessation of borrowing in sterling, or no borrowing at all, or borrowing in silver. But, as a matter of fact, they have been burning candles at both ends. At one end they are, under one pretext or other, increasing their sterling obligations, entailing heavier "loss by exchange," so called; while at the other they are incurring heavier expenditure on account of border warfare, generally unprovoked and uncalled for. Is it possible that a country situated as India is, under a foreign domination which drains away a greater portion of its annual surplus of wealth, can withstand that burden yearly growing heavier? (Hear, hear.) But this is the situation. The cry that so many crores of rupees have now to be annually paid as the equivalent of the sterling liabilities in a depreciated silver currency would never have been heard were it not for the policy which has entailed those obligations. Diminish these, and *pro tanto* so many less number of Rupees will have to be paid for the equivalent, which is the same thing as bringing greater relief to the Treasury. The cry, I repeat, must cease with the greater diminution in the home charges. But it should not be forgotten here that all these home charges are paid *in produce*. Therefore it has come to pass that, with the increased burden of exchange, the producers of produce have to part with larger quantities which, however, have not brought to them any corresponding gain in their money value. The economic effect of these charges is that prices of the staple articles of exports have been lower. At any rate, the ryot has parted with his larger produce at or about the same price that he did 20 years ago with a less quantity. We are nowadays hearing too much of this cant of larger exports. But a little study of the question will at once tell you that these larger exports, for a debtor country like India, mean nothing short of larger sacrifices of the national wealth. (Hear, hear.) And while such is the condition of the producers, they have artificially raised the value of the Rupee, which, it is superfluous to say, adds not a little to their burden. Whether there is any corresponding gain is problematical. Yet this important question has hardly been investigated by the Currency Committee.

To return to the home charges. Those having reference to the military expenditure are very considerable indeed. Many of these charges have been protested against. I am quite convinced that, if the burden on account of military expenditure alone was reduced, a material relief would be afforded, and India would be able to pay its way without the wail of exchange. This military expenditure, as I have often observed on the Congress platform and elsewhere, is the consequence of the policy of external aggression pursued by the English Government since the acquisition of Quetta in 1876 and the date of the second Afghan War. It is with a view to maintaining its supremacy in the East that England has, as the predominant partner in the matter of Army expenditure, under the fatal amalgamation scheme of 1859, imposed most inequitable burdens on India. These burdens have been inveighed against, not only by this Congress and by the country at large, but by the Government of India itself, in more than one public despatch. They were recounted before the Welby Commission. One of the latest despatches submitted to that body observed as follows:—"Millions of money "have been spent on increasing the Army in India, "on armaments and fortifications, to provide for the "security of India, not against domestic enemies, or "to prevent the incursions of the warlike people of "adjoining countries, but to maintain the supremacy "of British power in the East. The scope of all these "great and costly measures reaches far beyond Indian "limits, and the policy which dictates them is an "Imperial policy. We claim, therefore, that, in the "maintenance of British forces in this country, a just "and even liberal view should be taken of the charges "which should be legitimately made against Indian "revenues." (Hear, hear.)

It will be thus seen that part of the sterling obligations are unjustly foisted upon India; while part are increased, regardless of India's ability, and regardless of the economic conditions of the people. It is the combined pressure of these two burdens which have now proved too heavy to be borne; and that the so-called "loss by exchange" is the tangible manifestation thereof. If, owing to this exchange, the Indian Government now cries aloud for an alteration in the currency, is it not strange for it to ignore the very root and origin of that exchange? And, if the root can be eradicated, where may be the necessity of change in the currency? But it is most astonishing to observe that the Indian Government should beat about the bush, and attribute to silver all the faults which should properly be attributed to the *policy* which for years past is augmenting the sterling liabilities, of which the most inequitable and oppressive is the military expenditure. Again, to me it is most astonishing that not a single official or non-official witness has submitted to the Currency Committee this aspect of the present situation. Perhaps the only non-official witness who had a perception of it was Sir Forbes Adam, a gentleman of great Liberalism, than whom very few understand the real Indian view of this currency question. (Cheers.) His is a name to be conjured with. But even Sir Forbes was not able to bring clearly to the notice of the Committee this aspect of the currency to which I am now referring. The question was asked, if the currency was to remain undisturbed, how was the heavier loss by exchange, with the greater decline in the gold value of silver, to be met? To that it is a matter of regret no definite reply was made. Curtailment of home charges, specially military, should have been the answer. It is true that nearly one-third of these are on account of interest on guaranteed and State railways. But there has been a culpable neglect in this particular liability. It was years ago—I think

somewhere about 20 years since — that Sir John Strachey, as Finance Minister, recommended that the railway liabilities should be commuted into silver. Had that been adopted, the Indian Government might not have been in the sorry plight that it is to-day, and might not have thought of tinkering or tampering with the currency. But that recommendation was pigeon-holed by the India Office, vested interests being too powerful. As the time, however, for the purchase of the two remaining guaranteed railways is now very imminent, there is nothing to prevent the India Office from buying these companies off, and issuing the necessary debentures for their purchase in silver, say, at an annual interest of 3½ or 4 per cent., payable in silver; it would be a fixed and certain liability. The relief which might be given to India by this one transaction alone would more than compensate for all the evils the country has suffered in the past. I admit that vested interests will do their best to resist the suggested commutation. But, if there be sufficient moral courage and statesmanship at the India Office, the difficulties could be easily overcome. As to the interest on the sterling loans, which now average about 2½ millions, nothing need be said. The amount of interest is not so burdensome as the home charges of the military department, which in recent years has mounted up to 3¾ millions. In fact, Ladies and Gentlemen, you will perceive from the figures I am just going to quote, that, next to the interest on State and guaranteed railways, the heaviest burden of sterling obligations is on account of the Army services in England. In 1896–97 the various obligations stood as under:—

Railway interest - - -	5·80
Military charges - -	3·68
Interest on gold loans - -	2·67
Civil charges - - -	2·28

The balance is made up of miscellaneous items. It will be thus seen that, were there a curtailment of the military charges incurred at home, and were there a fair and reasonable commutation of railway interest into silver, the difficulties of the Indian Government would at once be solved. Where there is a will there is a way. But so long as no effort is made on behalf of the Indian people, and so long as the vested interests are deliberately pampered and nursed, there can be no hope of any financial salvation. Not even a gold currency may mitigate the growing burdens.

But I shall now specifically refer to these military charges which demand 3¾ million, and over, of sterling remittances per year. In my supplementary evidence, in connexion with the Welby Commission, I observed that the whole burden of exchange entailed on the Indian finances during the 10 years ending 1895–96 was 43 crores of rupees, or, say, 4·3 crores per year. Of this, as much as 27 crores, or 63 per cent., was on account of military expenditure alone. This heavy sum might have been considerably less but for the fact of the addition made to the army in India in 1885. Had the strength of the army been maintained at the figure it was prior to that year, I estimated that the military exchange would have come to 12·85 crores in the decade. Practically, then, the increased exchange which India had to pay in the 10 years for the increased army services came to 14·52 crores in 10 years. Now, I would for a moment endeavour to fix your attention to the net burden of new and enhanced taxation during the same period. In his rebutting evidence, given before the Commission on 21st July 1897, the late Mr. Jacob, whose premature death I and my other friends who were witnesses greatly deplore, and whose courtesy we all greatly appreciate, stated that taxation amounted to 22·31 crores. To this has to be added, as I pointed out, suspended famine grants and unrefunded provincial balances, amounting to 5·41 crores. The total comes to 27·72 crores. Now, according to Mr. Jacob's own figures, the increased cost on account of the increased troops amounted to 33·94 crores in 10 years, *without exchange*. With exchange it came to 48·46 crores. Had there been no additional troops, all this sum might have been saved, against which as much as 27·72 crores of new taxation, &c., had to be raised. In fact, while 48·46 crores might have been saved, the net expenditure on exchange, as just stated, would have been no more than 28·75 crores. Practically, the result would have been a surplus of about 20 crores in the decade, despite the fact that civil charges had also greatly increased, but some of which being of a reproductive character, much complaint against their growth need not be made.

From the above facts it would be clear to you that India has in no way suffered on account of exchange, because exchange would have been fairly met from the revenues, without even a pie of taxation, had it not been principally for the additional military expenditure. Is it impossible to curtail the strength of the army and bring it back to the number at which it stood in 1885? It would save the Treasury about 3·89 crores without exchange or 5·34 with exchange. This, again, brings us to the practical part of the currency problem. I answer the question which the Committee put to some of the witnesses, including Sir Forbes Adam. The Committee inquired of these witnesses how they would meet the extra charges which might have to be paid in case exchange went below one shilling, were the mints reopened. I say that these charges could be easily met by the curtailment of the military expenditure which now entails, per annum, a charge of 2·73 crores for exchange. If the army was reduced there would be a saving to the extent of 1·45 crores in exchange alone. The charges for army services proper would, besides, be less by at least 3 crores. Then, if England only contributes her fair share towards the cost of maintaining her supremacy, there would be a still further saving. Of late, we have heard that the Welby Commission may propose such a share, amounting to 1½ crore of rupees. But this is still a matter in the clouds till we know what the belated report of the Commission actually recommends. (Hear, hear.) Even then there is the British Treasury to deal with—a very tough and powerful obstruction. But the savings which I have just referred to should easily suffice to meet the extra demand for greater loss by exchange which has long been held out as a bugbear before the ignorant public. On my part, I do not think that, were the mints re-opened to free coinage, under proper safeguards and limitations, that the Government would find any difficulty whatever in meeting the apprehended greater loss, without a pie of fresh taxation. (Hear, hear.) Aye, not even if exchange went as low as 10*d*. But the fact nevertheless remains that it is the home charges which are at the root of the difficulty. Consequently the agitation should proceed, not for the reform of the currency, which has nothing the matter with it, but for the policy on the lines I have indicated. This practically means that the British Government should modify its present policy which regulates all expenditure. The economic evils of carrying on the administration by a costly foreign agency are entirely owing to the present mistaken policy. It is against this policy that Mr. Dadabhai Naoroji has been inveighing these many years. India is being bled to an extent unparallelled in the administration of any country in the world, ancient or modern. If the British Indian Administration is unparallelled itself, its bleeding of India, too, is unique. Cease that bleeding and India will revive. It will be soon in a position to accumulate the surplus wealth which is now drained to England, and have enough capital of its own to develop its material resources with great advantage both to England and India. As Mr. Dadabhai Naoroji truly observed at the meeting in Lancashire last month, the more India grows rich the more it will be in a position to extend its trade in Lancashire goods. Instead of its whole trade with the United Kingdom coming to only 2*s*. per head it would come to 20*s*. But the bleeding must cease before that happy event could be realised. It can only cease when the policy of the costly employment of the foreign agency, in all its ramifications, administrative and commercial, is reversed. The exchange difficulty, now so absurdly found fault with, will cease to exist. India would breathe freely. The currency will operate automatically as it has hitherto done, and both the State and the people will be prosperous. At present, not only are the people but their industries and manufactures throttled, and under a mistaken conception they are going to throttle them further by their insensate currency proposals.

It is to be devoutly wished that the Currency Committee will take evidence on all the points I have just referred to. The mass of evidence recorded up to date reveals absolutely nothing. And no one seems to have touched on these points, which alone, in my opinion, are most relevant to a correct diagnosis of the present complaint. Some witnesses have indirectly referred to the points, specially Sir Forbes Adam, with his unique experience of the Indian people and the Indian economic question. I for one must admit that I am altogether disappointed with the whole evidence. It is mostly official or officialised. The independent evidence, if at all, is on the side of those who are for the re-opening of

the mints, though, in interested quarters, we have off and on been told, there is the strong belief that it is beyond all hope. That remains to be seen. Lord Rothschild believed in extended exports first and extended railways afterwards. But when may we expect extended exports? Not while the exchange compels, under the present unnatural policy, the producers to part with their produce at low prices. Not while India continues to be a debtor country. The exports would be beneficial to India only when the unnatural economic condition ceases. It is therefore to be earnestly hoped that evidence of competent representative Indians will be taken by the Currency Committee in order to arrive at a correct understanding of the economic situation, and be able to advise the Secretary of State as to which is the right and proper remedy to be adopted in the matter. (Hear, hear.)

If then, I repeat, the military expenditure was curtailed and brought down to the figures at which it stood in the time of Lord Northbrook and Lord Ripon, then I say with confidence, and without the least hesitation, that the entire financial situation would be materially altered for the better. India might pay its way without adding a pie to the existing taxation. Again, if the fire-works which are incessantly being let off at a heavy expenditure, which has averaged over one crore during the last 12 years, beyond the statutory limits of the country, are put a peremptory stop to, and if the many domestic reforms that have been hung up for many years past, as our friend Mr. Surrendranath Bannerji observed yesterday, were taken on hand, India would really be in a condition of progress. And I may here take the opportunity to remind you, Ladies and Gentlemen, that the Herschell Committee had strongly recommended curtailment of expenditure as a first step before taking any action whatever with regard to the closure of the mints. So that, in recommending curtailment of expenditure, I am not recommending anything new. This curtailment can only follow a change in the present policy, which is erroneous. When the policy is put on a sound and natural basis the aspect of expenditure will also be changed, and changed for the better. The whole question therefore to be determined is not currency, but *policy*. We must agitate from year to year until the present policy undergoes a material modification. We must agitate till we drive home the truth so clear to us, that the unnatural system of administration is at the root of the financial difficulties and not currency. We should leave no stone unturned to bring the authorities to discern this aspect of the question, if indeed they are not already aware of it. During the 14 years that the Congress has successfully held its annual session, I have found that on almost all the burning questions of the day, the original views held by it, though at first ridiculed and discredited, have at last come to be recognised and acted upon. That experience tells me that in this matter also the position which the Congress will take up in the spirit of the resolution I have moved will eventually be proved to be absolutely sound. This is my firm conviction, and on the strength of that conviction I now commend the resolution to your judgment. (Applause.)

No. 28.

Memorandum by Mr. W. Martin Wood.

The Committee have already had put before it such a mass of statements and opinions regarding currency and exchange that it would seem superfluous to attempt to add to that portion of material. On the other hand comparatively little consideration seems to have, as yet, been given, in the course of examination, bearing on the monetary financial relations between India with the United Kingdom, which really lie at the root of the whole matter. In the tables and statements presented by the two delegates of the Indian Finance Department ample statistics as bases for such consideration are on record. Whether these comprise all the information that would elucidate the history of the large subject in its bearing on the present situation, the present writer is not aware; but Mr. O'Conor could easily supplement the material of that kind if desired. If the direct causes of the present perplexing situation can be traced in their proper sequence it is reasonable to expect that such analysis would indicate the only true and safe way out of the anomalies and paradoxical position in which Indian currency and trade financial affairs have drifted.

2. It appears eminently desirable, for instance, that the attention of the Committee should, without further delay, be drawn to the actual history of the subject in order that the present results of that sequence of events may be rightly estimated, before any practical conclusions are adopted or any definitive measures are determined upon. At some points of that history, during the last 35 years of India's financial and currency movements, it necessarily touches on some of the outside, and, for this purpose, superficial events connected with gold and silver production or the corresponding changes in other nations' currency regulations; but it will be desirable to keep separate, as far as may be, these inside and outside divisions of the problem.

3. The Committee might do well to consider the remarkable contrast presented by the circumstances in which India found itself in 1863–66 and these of the present day. At that period and in consequence of the large increase in gold production, beginning in the fifties, gold was becoming plentiful as compared with the production and then use of silver as currency. Many Anglo-Indian authorities at that time feared that the supply of silver might become stinted and India would thereby become subject to fall in prices and the serious inconveniences that always result from rapidly restricted currency. Therefore many persons—foremost amongst whom as a member of the Supreme Executive Council was the then Sir William Mansfield—thought it desirable to seize the opportunity, then apparently feasible to adopt a gold standard, and introduce that metal into the currency; though it was intended to retain silver as the chief material of circulation, and also to extend the use of currency notes There were also proposals, at that time, to attract gold into circulation as legal tender (not as standard) subject to periodical readjustments, while retaining the silver standard tola rupee. Should the present Committee find itself compelled to fall back upon tentative expedients, such proposals may still he worth examination subject to the altered conditions of the present time But this is only an incidental remark by the way.

4. When the Committee comes to consider the financial practicability of establishing a gold standard for India, with or without any appreciable use of the metal in the currency, the contrast between the comparative ease with which that course could have been taken in 1863–66, and the enormous difficulties in the way of such a course at the present day, may induce the Committee to pause. They might, on facing those financial obstacles, come to recognise them as so formidable as to lead them to perceive that it may be wiser to revert to the natural position before 1893, than to persevere with artificial wrenching processes entered on then, and as now proposed to be extended. If the factor seen on the surface, "loss by exchange," is urged as forbidding such reversion for India to the silver standard and automatic coinage, the Committee may be asked to suspend their judgment until, in a later passage in this Memorandum, the one obvious method of largely mitigating that political financial "loss" shall be explained.

5. Now let us look at the contrast presented between the monetary metallic situation in 1863–66, and what obtains at present. The relative market position of gold and silver would then be about 15.35 to 1: now it is say 30 to 1; but the Committee have before them evidence as to this to the utmost fraction. *See also* Mr. Barr Robertson's paper with its tables.—Society of Arts Journal, No. 2,098, February 3, 1893. In comparing that essential contrast, indication is afforded of the almost incalculable cost that will be involved in now adopting a gold standard for India, to say little as to drawing that metal into the currency. Even in the former period, it was seen that a few millions would have to be found for starting the moderate plan described above (paragraph 3). It was thought that five or six millions would, at least, be required. Later, in 1893, it was thought that 30 millions would be needed to carry through the more complete gold standard scheme which only then began to be entertained. But what figure can indicate the cost, however it may be met, and the sacrifices, however they may be endured, before the full levelling up of India to a gold standard and currency can be accomplished? The Committee have within its reach abstruse calculations, as well as many haphazard and pre-conceived speculations to choose from in forming any tangible estimate of the present and ultimate cost of carrying through this immense monetary wrench. It may safely be assumed

that 50 millions sterling is a moderate estimate of the cost of this enormous operation in the circumstances of India.* Any estimates founded on corresponding monetary changes amidst the highly organised credit facilities of the western world are manifestly inapplicable to the present problem. While as to which fiscal system and which constituency is to sustain that cost, is quite another question that must not be ignored.

II.

6. Now let us revert to the history of the causes that have resulted in the present situation. The next landing-stage was reached in the circumstances investigated by Mr. Goschen's Silver Committee which reported in 1876. That Report greatly dissipated the popular misconception that the fall in the gold price of silver was wholly due to the demonetisation of silver by Germany and the subsequent withdrawal of France from the Latin monetary union. It was demonstrated in that Report that the influence of the Secretary of State's drafts on the Indian treasuries is far more weighty and persistent in keeping down the market price of silver (and in adding to the Government of India "loss by exchange") than all other causes then prevailing. It was pointed out in the Report that "the "supply of a different kind of remittance, namely, "Government bills, has *superseded* to a large extent the "necessity of remitting bullion . . . It will be seen that "though the total amount of treasure and Bills remitted "to India during the last four years 1872–76 has but "slightly declined, the proportion between the two has "been *entirely reversed*." And a table is given showing that, whereas in the period of 1868–69 to 1871–72 the average annual import of treasure into India was 10,000,000*l.* and Council Bills 7,000,000*l.* in the period from 1872–73 to 1875–76, the average had been respectively 4,100,000*l.* and 12,000,000*l.* In the year 1875–76 the figures were—treasure, 3,100,000*l.*, and Bills, 12,000,000*l.* It was added: "Whatever the "effects of reduction in silver imports may be, they are "simply to be accounted for by the large amount of Bills "on India which the Indian Government (that is, Secre-"tary of State) has now to sell." It may be noted that in the six years ending 1881–82 the net imports of treasure into India were rather over 53 millions, and Council Bills were 84 millions. These six years included 1877–78 when imports of treasure were exceptionally large (over 15 millions), because of famine demands and sterling loans taken up. It may also be stated that in the 10 years ending 1891 (in which year import was very large), the net imports of treasure into India were Rx. 129¾ millions, and Council Bills drawn, Rx. 198 millions. In the three years 1894–97, the treasure imported was rather over Rx. 18½ millions, but the payments for Bills drawn to defray Home Charges amounted to over Rx. 86 millions. But the Committee have before it all the figures that exhibit the competition between imports of treasure and India Office Drafts, notably so in Sir David Barbour's tables of 1885, which also show the immense addition to the Home Charges Drafts since 1872—one of the great facts that the Committee has to deal with.

7. Here, in passing, as explaining the proximate cause of increase in the volume of Drafts from an average of about six millions in the three years ending 1871 to the 10 millions in 1872, and 14 the following year, this was due to the diminution, and almost cessation, of payments into the India Office of the sterling capital raised by the great guaranteed railway companies. Whilst that lasted the drawings were abated to that extent. Similar temporary effect is induced when new sterling loans on public account are taken up in this country. But these differences are only on the surface. Behind and beneath these superficial adjustments, the charges drawn from India and disbursed in the United Kingdom remains the one constant fact that has to be kept in view all through. These direct charges which up to nearly 1860 scarcely averaged three millions per annum, are now six times that amount; and this constitutes the great change in circumstances which underlies the questions the Committee has to consider.

8. To revert to the course of evidence showing that the largest and most persistent disturbance of the ratio between gold and silver, with the consequent monetary and commercial disturbance of the financial relations between our great dependency and this the mother country, reference may be suitably made to the remarkable treatise by Mr. R. H. Hollingbery, the Assistant Secretary in the Finance Department of the Government of India, a similar position to that now occupied by Mr. J. E. O'Conor. That work was compiled before the appointment of Mr. Goschen's Silver Committee, and its conclusions as bearing on the monetary financial position were, of course, worked out independently. Our concern with Mr. Hollingbery's conclusions lies apart from his exhaustive exposition of the statistics relating to the production with relative values of gold and silver, from the earliest to the latest period, and to the distribution of the precious metals amongst the various nations of the world.

9. That portion of this invaluable essay explaining the large subject with which the Committee has now to deal—under the greatly enhanced and accumulated difficulties of the present day—is comprised in Mr. Hollingbery's paragraphs 242–70 taken with paragraph 275–76, in which latter the whole statistical argument is concisely summarised. In entering on this exposition he founds himself on the concluding passage of J. S. Mill's chapter on "The Distribution of the Precious Metals" (section 4), in which is demonstrated the effect on prices and return to the producers that follows from "the existence of inter-"national payments not originating in commerce and for "which no equivalent in either money or commodities "is expected or received." As that eminent authority shows, "the result is that the country (as in the case "of India) which makes regular (obligatory and un-"balanced) payments to foreign countries (as to the "United Kingdom) besides losing what it pays, loses "also something more by the less advantageous terms "on which it is forced to exchange its productions for "foreign commodities, and . . . . . the result "to the interest of the two countries will be . . . "... the paying country (*i.e.* India) will give a "higher price for all that it buys from the receiving "country, while the latter (*i.e.* England) besides "receiving the tribute, obtains the exportable produce "of the tributary country (India) at a lower price." Mr. Hollingbery proceeds to apply this principle, in clear easy expression, to the actual circumstances of India, and includes the important remark that the adverse or "reduced price at which they (exports in "direct payment of Home charges) are offered affects "also the exports which are exchanged for imported "goods. Thus the gold price of Indian productions "must fall (*i.e.* be continuously under-valued) and with "them must fall the price of silver."* It should be mentioned that in Mr. Walter Bagehot's Essay on the Silver Question (1878), the economic effects on prices and products of non-commercial obligatory payments by a dependency were similarly explained in somewhat more popular form.

10. Now then we come upon the centre or crux of the problem that has to be faced, the very heart of the subject which the Committee has to consider. Compared with this central and permanent aspect of the matter, debates regarding different forms of currency or exchange fluctuations are beside the mark; or, at best, only deal with temporary or superficial circumstances. And, it must be remembered, that all the essential factors described 20 years ago as being adverse to India are now pressing on that country and its peoples with, say, five times additional weight; while certain of the proposals now influentially advocated, involving on one hand increased cost of its circulating medium and on the other restriction of its currency, would add incalculably to that pressure and burden.

---

* Mr. H. Dunning MacLeod has recently drawn attention to the Government of India's Notification of December, 1852, by which gold, *i.e.*, mohurs of 16 and of 15 rupees, was demonetised in India. He states that "by this astounding *coup de finance*, "utterly without precedence in the history of the world, it was "estimated that 120,000,000*l.* of gold coin at once disappeared "from circulation and was hoarded away." As to what this estimate was founded upon does not appear; but Mr. MacLeod must be under much misconception as to India having then "an immense gold currency in circulation"; and this, apart from the estimate of amount, is the only practical consideration. That gold mohurs were spoken of in accounts and charges until a later date we all know. But there is no proof, that I am aware of, that gold formed any appreciable portion of the actual circulation.

* Appendix I., pp. 64–5.

III.

The Way Out.

11. This is simple and obvious; though difficult because of political obstacles and financial requirements. It has been shown that the present crisis as between India and England, including the "loss by exchange," has arisen from the ever increasing pressure, dating from 1872–73, of the demands on India for expenditure in England, in popular phrase the Home charges. Thus the obvious remedy is the reduction of these demands, or the finding of some appreciable set off against them. If the drafts on India were reduced by one-half the true exchange value of the rupee would speedily rise, not only to 16*d.*, but probably 18*d.* or higher. Even if only one-third of the drafts were cut off, probably some such measure of equation would be reached. And with such adjustment, incalculable relief would be gained if the automatic currency were restored; or, in the alternative, if the Government of India, taking direct control of coinage, were to freely replenish the now rapidly exhausting volume of currency. The market price of silver would also respond to that change. This proposition derives support from the facts recorded above as to the history that has led up to the present situation.

12. This is no new proposal. More than 40 years ago it was described thoroughly and with due discrimination by Sir George Wingate, R.E., and it has since been supported by competent authorities. Wingate's essay is very scarce, but a copy should be in the India Office library. The essential portion for the present purpose is set out in Part 1, Vol. XX. of the East India Association Journal, 1883, pp. 28–30. (*See* Appendix II., p. 65.) Wingate's statement of the equitable demand that the British Treasury should sustain a considerable portion of the annual cost of maintaining that sway over the Indian Empire which results in incalculable profit and prestige to this country, is so lucid and convincing that the Committee cannot well afford to pass by this argument, which goes to the very core of the whole subject. It shows the natural way out of the otherwise insoluble problem before them. It is independent of, and superior to all outside circumstances, and apart from the artificial difficulties which have accumulated in attempts to evade the true remedy for India's now hapless monetary and financial condition.

13. This general principle that it is unjust for India to have to pay for every outlay that can be brought into her expenditure accounts—even when large portions of that outlay has been avowedly for Imperial purposes—has been affirmed by public men of all parties on various special occasions. That principle was acknowledged and freely acted upon when it was sought to charge India with the chief cost of the 1868 expedition in Abyssinia. This was successfully resisted by Henry Fawcett, and the late Earl of Derby (then Lord Stanley) frankly admitted that such charge would be unjust. Again this principle was affirmed in the case of the Afghan War of 1878–80. On that occasion Mr. Fawcett moved this amendment in the Address:—

> "But humbly desire to express our regret that in view of the declarations that have been made by your Majesty's ministers that the war in Afghanistan was undertaken for Imperial purposes, no assurance has been given that the cost incurred in consequence of the renewal of hostilities in that country will not be wholly defrayed out of the revenues of India."

Eventually, the principle was adopted, in so far that one-fifth of the cost of that Imperial and British Cabinet's war was refunded to India with consequent saving by avoidance of loss by exchange on that amount, viz., 5,000,000*l.* As bearing on the permanent and continuous fact that the Home charges represent the cost that India directly pays for that maintenance of our power over that Empire, it is well to cite the remarkable declaration by Mr. Gladstone, implying cogent and continuous application to this claim that India ought not to bear the burden alone. He said on that occasion:—

> "As regards the substance of the motion, I cordially embrace the doctrine of my honourable friend the member for Hackney. There is not a constituency in the country before which I would not be prepared to stand, if it were the poorest and most distressed in the land, if it were composed of a body of men to all of whom every addition of a farthing for taxes was a sensible burden, and before them I would be glad to stand and plead that, when we have made in India a war which our own Government have described as in part an Imperial war, we ought not for a moment to shrink from the responsibility of assuming at least a portion of the cost of that war, in correspondence with that declaration, instead of making use of the law and argument of force, which is the only law and the only argument which we possess or apply to place the whole of this burden on the shoulders of the people of India."

At a later period (May 1893), the Earl of Northbrook brought this equitable financial claim before his peers. One passage in his speech being retrospective and comprehensive covering scores of millions of really joint charges all forced on India, may be quoted here:—

> "The whole of the ordinary expenses of the Abyssinian expedition were paid by India. Only extraordinary expenses being paid by the Home Government, the argument used being that India would have to pay her troops in the ordinary way, and she ought not to seek to make a profit out of the affair. But how did the Home Government treat the Indian Government when troops were sent out during the mutiny? Did they say, 'We do not want to make any profit out of this?' Not a bit of it. Every single man sent out was paid for by India during the whole time, though only temporary use was made of them, including the cost of their drilling and training as recruits until they were sent out. Surely in justice the same principle should be applied both ways."

As one moderate application of the principle of equity his Lordship made this practical suggestion, thus: "As to four millions increase in the non-effective "charges in 14 years up to 1884, I think half that "should be borne by the Imperial Exchequer. It "should take over two millions." In the budget for the current year that head of the Home charges figures for Rx. 6,700,300. It affords a striking illustration of the monetary-currency bearing of this factor and the joint account, that were only that head of charge to be sustained by the British Treasury the saving in cost of exchange would be Rx. 1,405,200. The Committee can readily estimate what percentage this diminution would save or add to the exchange value of the rupee. On the occasion above referred to, the Earl of Kimberley in his apologetic reply as Secretary of State for India remarked, *inter alia*, "Pressure is brought to bear for "some change in our (Home Army) system, and the "expense of our (Indian) Army is accordingly increased. "The War Office yielded to the pressure and the India "Office finds itself saddled with additional charges in "respect of which it has really had no voice . . . . "The consequence is we have charges put upon us in "connection with India which are both unjust and "unnecessary." At a later period of that Session (July 31) the Duke of Argyll reverted to the subject under his sense of responsibility as a former Secretary of India, with reference to these exchange and finance difficulties which, as he said, "arise to a large extent "from the Home charges made against the Indian "revenues by the Home Government here." After explaining how charges strictly pertaining to this United Kingdom are sought to be thrust on the dependent country by the spending departments here. His Grace said, "this meant that India was called upon "to pay a tribute to the country;" later on, he added, "he certainly thought that the people of India ought "not to be called upon to pay anything in the nature "of a tribute or more than the actual cost of our troops "when employed in India, which was the old legal "and constitutional principle. He thought that the "balance of benefit was enormously against India and "in favour of England." The trend of His Grace's arguments all through that speech is that the perdurable and inevitable financial and monetary effect of these abuses and exactions are above and beyond any currency disturbances or monetary contrivances real or artificial —which is the contention of this memorandum. It might be well for the Committee to have before them the letter from the India Office (dated August 9th, 1872) for which the Duke then moved, also the two other documents (of 1874 and 1876) which the Earl of Northbrook moved for on the same occasion. In closing these references to financial claims on India's behalf which, if fairly met, would go far to cover the Committee's mandate, it may be well to remind its members of

the remarkable consensus of opinion that obtained amongst public men of all parties in the earlier part of this year (1898), on behalf of making an imperial grant in relief of India's severe financial and monetary difficulties caused by the (Imperial) War beyond her borders, by famine and pestilence. These recommendations, though mainly proceeding on grounds of compassion rather than of international justice—which is the true and abiding consideration—were creditable to those who thus gave expression to the better side of the British character. That gleam of political equity and true financial insight was afterwards obscured by short-sighted pleas and evasive excuses; but the Committee is in a position to perceive what a large practical influence such grant would have had on the finance of the current year, and by illustration, on the present unsolved monetary and exchange difficulties of India.

14. Here to revert to the technical side of questions raised in course of the Committee's proceedings it may be pointed out (as in paragraph 5 above) that the monetary and trading conditions of India are essentially different from those of the Western world. Here, questions of currency have only indirect relations to the money-market and commercial finance. There, those two branches of monetary affairs are almost inseparable—or, were so, until the violent wrench forced on them when the measure of June 1893 began to operate. Much of the evidence placed before your Committee will show this. And the statements recently made by an experienced Calcutta merchant, Mr. David Yule, are very timely in the way of explaining the intimate connection in India, hitherto, between currency and trading funds. Alluding to the recent cry of lack of loanable capital—as to which the ever expanding need was being fairly met until stopped by closing of the mints—he points out that so long as silver bars or ornaments were convertible into rupees those reserves supplied and invited funds into the interior; and he describes how this ready convertibility gave confidence to the thrifty portion of the population, also facilities for the money-lenders. But since these funds in the shape of rupees were made by the Act of the State into "dead metal difficult of sale," there has been, as Mr. Yule computes, "a loss of loanable capital to the extent of 150 crores of rupees." Whatever may be the opinion as to this amount, he goes on to point out that the effect of depriving them of the use of their savings has been to drive them (the people) into the clutches of the money-lenders. In turn, these retail bankers have "become anxious about their outstandings," and are "refusing to make advances to pay for seed and cattle." The first effect of this was to drive the village banker's spare funds into the presiding towns—not for trade purposes, but to be invested for safety, in gold or silver bullion, the trade use being thus lost to the country. And Mr. Yule considers that this lack of convertible currency is driving trade in the interim into a state of barter, which "is a menace to the export as well as the import trade of India." Here we have a demonstration of the inseparable connection in India between currency and loanable trade funds. Mr. Yule is of opinion that further contraction of the currency as proposed, will "carry with it ruin and disaster to all concerned." Alluding to the comparatively prosperous state of trade in the period of fifteen years up to 1893—owing mainly to cheap silver currency and the frequent diminution of Council drafts—this experienced Indian merchant expresses his conviction that "the country was ripe for a very heavy *increase* in her currency." This expression of opinion by a local authority, who knows the monetary condition of the interior as well as that of the presidency towns, ought, it seems to me, to be well weighed by the Committee in view of the policy of contraction of currency and denudation of trade funds that now obtains, and which it is gravely proposed to carry out to the bitter end of an artificially created "stable exchange." With regard to the present superficial remedy for the monetary and financial difficulties of the Indian Government much that has been written above suggests obvious reply. It is claimed that by closing of the mints and forcing up the gold value of the rupee a sum of nine million sterling in cost of exchange has been saved to India. It would be difficult to find a more striking illustration of the tenacious economic fallacy in failing to distinguish between "What is Seen and what is Not Seen." Granted that the nine millions have helped to balance budgets; but, whence comes it? The witness who cited that figure lightly remarked, "it has been practically an indirect tax on the people." So that it has really been got into the budget by a sacrifice or loss to the people of India. And it cannot represent the whole loss imposed thereby on production and trade profits. The heavy discounts that had to be paid on trade bills a few months ago in India afford some indication of the *unseen* loss, in the light of such explanations as that by Mr. Yule, as also by some witnesses before the Committee, that nine millions "saved" must represent a far heavier sacrifice to a country backward in all the mechanical appliances of civilisation, and without the automatic facilities derived from the credit systems in Western countries. As certain as that water under pressure will find its level, so surely must any artificial currency or exchange gains that can be devised, result in real sacrifices by, and incalculable burdens on, the community. Hence the deep responsibility on the Committee to consider well that which is the crux of these instructions—to report upon "the monetary "system now (*i.e.*, before 1893) in force in India "and the probable effect of any proposed changes "upon the internal trade and taxation of that "country."

15. Briefly to summarise the contents of this Memorandum:—

(*a.*) The contrast as regards the relative value of gold and silver at the present time, and that in 1863-65, indicates the extent of the financial difficulty that has to be faced in the proposal now to establish a gold standard for India.;

(*b.*) The preponderating cause of the divergence between gold and silver and the consequent "loss by exchange" is due, as shown by Mr. Goschen's Committee of 1876, and by Mr. Hollingbery, to the large increase in the demands on India for expenditure in England—which, up to 1872, had been disguised by payments here of railway capital; and, since then, intermittently, by taking up of sterling loans—debt growing meanwhile.

(*c.*) That these unbalanced withdrawals of revenues and resources constitute the predominating adverse factor in India's monetary, commercial, and industrial condition; and, besides being a direct unrequited outlay, forces India to exchange its products for the foreign commodities it receives on less advantageous terms (J. S. Mill, &c.) than such as are obtainable under normal conditions of international commerce.

(*d.*) That any artificial device for evading "loss by exchange," either by forcibly changing the material of currency (regardless of cost) or contracting the internal currency, must add to the pressure on India's monetary resources and to her trading disadvantages: the only real relief, and sole safe means of restoring India's trading energies and industrial efficiency, is to be found in the master country agreeing to sustain its equitable share of those disbursements here which represent the net cost to, and sacrifice by India for maintenance of our sway over that Empire.

(*e.*) That the principle of this equitable policy has been affirmed by competent authorities and various British statesmen; also that the demonstrable economic results of its practical application, while relieving the Indian people from monetary pressure too grievous to be borne, would largely increase profitable commerce with that country and strengthen its political and financial relations with the United Kingdom.

W. Martin Wood.

September 8th, 1898.

Appendix I. to No. 28.

From Mr. Hollingbery's Treatise.

. . . . . the Home Government's bills of each year, prevent, for that year, the importation into India of a corresponding amount of bullion.

244. The importation of bullion into India does, indeed, depend on the excess of her total exports over her total imports, and on the portion of that balance which cannot be settled by bills; but—especially in the present question of prices—it is necessary to distinguish, as the extract from Mr. Mill suggests, between the two portions of those exports which make up the gross balance of trade "in favour of India," and also enter into the net balance that has to be settled by an import of treasure.

245. The exports from India consist of:—

(*a.*) The exports which are exchanged against imports of merchandise. If India did not incur a large amount of Home charges, her exports would increase, generally or chiefly, from a demand abroad for them, in which case they would go forward at a higher gold price abroad, as well as in increased quantities, causing (if not counteracted by an increase of imported goods) an increased import of silver which would raise the price of silver abroad. In other words, an increase of exports from India, if not arising from the Home charges, will generally imply an increased gold price of Indian productions and an increased price of silver abroad, or in, say, London, the world's market. This was the case during the cotton famine.

(*b.*) The exports which India has to send forward to Europe to provide for the Home charges. As pointed out by Mr. Mill, these exports not being required in exchange for goods must be offered at reduced prices abroad, so as to create an increased consumption of them. But, necessarily, the exports which go to England for the Home charges (in the place of silver from India) are not earmarked, and the reduced price at which they are offered affects also the exports which are exchanged for imported goods. Thus the gold price of Indian productions abroad must fall, and with them must fall the price of silver; for the diminished amount, in gold value, of Indian productions which are exchanged against goods and silver, reduces the amount to be settled by an importation of silver upon the account A.

APPENDIX II. to No. 28.

EXTRACT from "*A Few Words on our Financial Relations with India.*" By Major (afterwards Colonel Sir George) Wingate, R.E.: Richardson Brothers, 1859, pp. 57–64.

There does not seem to be any insuperable difficulty in the way of discovering the principles upon which the financial relations of India with this country should be settled. With reference to its economical effects upon the condition of India, the tribute paid to Great Britain is by far the most objectionable feature in our existing policy. Taxes spent in the country from which they are raised are totally different in their effect from taxes raised in one country and spent in another. In the former case, the taxes collected from the population at large are paid away to the portion of the population engaged in the service of Government, through whose expenditure they are again returned to the industrious classes. They occasion a different distribution, but no loss of national income, and hence it is, that in countries advanced in civilization, in which the productive powers of man are augmented by mechanical contrivances, and a judicious use of the powers of nature, an enormous taxation may be realised with singularly little pressure upon the community. But the case is wholly different when the taxes are not spent in the country from which they are raised. In this case they constitute no mere transfer of a portion of the national income from one set of citizens to another, but an absolute loss and extinction of the whole amount withdrawn from the taxed country. As regards its effects on national production, the whole amount might as well be thrown into the sea as transferred to another country, for no portion of it will return from the latter to the taxed country in any shape whatsoever. Such is the nature of the tribute we have so long exacted from India. And the burden of a tribute is aggravated in proportion as the tributary country is backward in civilization, and possesses few mechanical and scientific aids for augmenting its productive power; for the net income of such a country, or the surplus of the gross produce of the nation's industry over and above the quantity required to replace the amount consumed in production, must necessarily be small. A country in the high state of industrial development of our own, could probably pay in tribute one half of its whole taxation more easily than India could pay one tenth, which was not far from the proportion that the tribute bore to the gross revenues before the outbreak of the mutiny. From this explanation some faint conception may be formed of the cruel, crushing effect of the tribute upon India. Let the reader endeavour to picture to himself what the present conditions of India would have been had the 30 or 90 millions of Indian taxes, which have been transferred to this country in the present century, been spent in India upon reproductive public works calculated to augment the producing powers of that country. India would long ago have been penetrated in every direction by roads, canals, and railroads. Agricultural produce would, by means of the facilities of transit thus afforded, have been drawn from the remotest parts of the interior to the seaboard for export to foreign countries, and those regions which now cannot import, because they cannot export, would have become consumers of foreign commodities in exchange for the produce thus sent away. It is probably a poor and inadequate conception to suppose that the net surplus of Indian industry beyond the cost of production, as distinguished from the gross production, would by these means have been doubled or trebled. And as this net surplus forms the fund by means of which a country obtains its imports of foreign commodities, it is not unreasonable to infer that the exports and imports of India, would have been double or treble what they are now. Let the people, and especially the manufacturers of this country, lay it to heart, that but for this cruel and sordid tribute, by which the total annual income of this country has been augmented by two or three [of late years say ten] millions, our exports [of merchandise] to India, instead of being from ten to sixteen [thirty to forty] millions might have been from twenty to fifty [sixty to one and fifty hundred] millions. For an income of two to three [say ten] millions we have sacrificed a trade of ten to twenty-five [forty to eighty] millions. Let the people of England, and especially the manufacturers of Lancashire, count the cost.

The Indian tribute, whether weighed in the scales of justice or viewed in the light of our own true interests, will be found to be at variance with humanity, with common sense, and with the received maxims of economical science. It would be true wisdom, then, to provide for the future payment of such of the Home charges of the Indian Government as really form tribute, out of the Imperial Exchequer. These charges would probably be found to be the dividends on East India stock; interest on home debt; the salaries of officers and establishments and cost of buildings connected with the Home Department of the Indian Government; furlough and retired pay to members of the Indian military and civil services, when at home; charges of all descriptions paid in this country, connected with British troops serving in India, except for the purchase of stores to be sent to India; and a portion of the cost of transporting British troops to and from India. In regard to the last item, it would seem to be a fair and most convenient arrangement for the British Government to pay the cost of chartering ships, &c., for the transport of troops to India, and for the Indian Government to bear the cost of sending them home again. In fine, the tribute is made up of such items of charge, connected with the Government of India, as are spent in this country, and for which India receives no material equivalent in any form. In defining the future financial relations of India and Great Britain, it would seem to be a most just and equitable arrangement to require each country to furnish that portion of the total cost of Government, which is expended within its own limits and goes to the support of its own industry. Upon this principle, British troops, actually serving in India, would not have to be supported by this country, as in the case of the Colonies, but would be paid by India [as they are now], and only such officers and men of Indian regiments as might happen to be at home would be paid from the British Exchequer.

What appears to be most urgently required is the appointment of a Royal Commission of first-rate men, thoroughly competent to the investigation of

economical, political, and moral questions, for the purpose of inquiring into the present financial relations of Great Britain and India, as compared with those of Great Britain and our other dependencies and colonies; and of ascertaining the various items of the Home charges which may properly be viewed as a tribute paid by India to this country, as well as their total amount since the commencement of the present century; and to report upon the probable effect of this tribute on the condition of India, and the best means of adjusting the financial relations of India and Great Britain for the future, so as to secure the greatest amount of advantage to both countries. . . . . Such a Commission would have no occasion to proceed to India for the purpose of collecting information, as the whole of the data necessary for the formation of a sound judgment upon all the questions that would be referred to them for investigation, is already to be found in this country in an available shape. A few months at the utmost would suffice for the prosecution of their inquiries and the preparation of their report, which would go forth to the country with all the weight of authority attached to the conclusions of men selected for eminent ability and familiarity with the questions submitted to their judgment. . . . . Were India to be relieved of the cruel burden of the tribute, and the whole of the taxes raised in India to be spent *in* India, the revenue of that country would soon acquire a degree of elasticity, of which we have at present little expectation, and certain branches of the existing taxation might even be safely increased, so as to ensure a sufficient surplus revenue for developing the resources of the country by means of reproductive public works.

See also the concluding portion of J. S. Mill's chapter on the *Distribution of the Precious Metals.*

[N.B.—The numerical terms within brackets on page 65, column 2, are not in the text, but were inserted (in 1883) so as to adapt Wingate's argument in the heavier Home charges and larger trade figures of recent years.]

No. 29.

FURTHER MEMORANDUM by MR. W. MARTIN WOOD (to complete SECTION III. of his MINUTE printed in APPENDIX to EVIDENCE given before LORD HERSCHELL'S CURRENCY COMMITTEE of 1893).

This broad fact, that the cause of prices *not* having risen in India in accordance with the cheapness of its currency standard metal, is, that the natural flow of silver has been checked by the extraneous financial demand represented by the increase in Council Bills, is strikingly shown by comparison in these two respects, between the eleven years ending 1872, and the similar period ending 1883, as thus set out—

	Rupees.
Council Bills from 1862 to 1872 (both inclusive) - -	71,61,56,776
Council bills from 1870 to 1883 (both inclusive) - -	175,40,45,677
Annual average of former period	6,51,05,160
Annual average of latter period	15,94,58,091

Net Imports of Treasure during corresponding periods:—

	Rx.
1862 to 1872 - - - -	159,660,000
1873 to 1883 - - - -	82,190,000
Annual average of former period -	£14,510,000
Annual average of latter period -	£7,460,000

As it is only silver that affects currency and trade finance in India, the gold included in the total of Net Imports of Treasure does not count in this particular comparison, which is therefore all the more striking. It will be seen from the above that, whereas during the earlier of these periods the imports into India of bullion and specie were nearly twice the amount of such imports in the latter period, while as to Council Bills there were in the latter period two and a half times the amount in the previous eleven years, thus affording a clear demonstration that the Secretary of State's demands (*i.e.*, Bills on the Indian Treasuries) supersede *pro tanto* bullion imports into India. The *silver* taken by India in the former period amounted to close on Rx 160,000,000, and in the latter to barely 80,000,000; so that it is a matter of surprise that prices in India did not go *down* in presence of such greatly diminished supplies of the standard metal, whilst internal trade was extending with increased railway communication, and the growth of population.

That prices had not gone down so much as the diminished supply of silver would imply is partly accounted for by two circumstances: (*a*) The coinage of silver in India appears to have exceeded by five or six millions (Rx) the total net imports of the white metal during the later eleven years in evidence. thereby indicating that the excess had been drawn from silver previously in India; and (*b*) the increase on the note circulation in the same period of about (Rx) five millions.

Incidentally, it may be remarked that we have here a practical illustration of the axiom as to the direct relations between prices and the volume of currency.

No. 30.

MEMORANDUM on DISCOUNT RATES in INDIA by Mr. J. A. ANDERSON and Mr. H. M. ROSS.

Calcutta, 1st June, 1898.

The accompanying tables and diagram admit of easier explanation if we roughly separate into three great divisions such money in India as directly affects the rates of discount. This money may be classified as follows:—

Division 1.—That employed in Native banking and commerce.
„ 2.—That employed in European banking and commerce, including the deposits of Government with the Presidency Banks.
„ 3.—Coin in the Government Treasuries.

On reference to Table A it will be seen that the rates of discount that have prevailed in Division 1 compare advantageously with those obtainable under Division 2. For the period over which the comparison extends small native traders were able to discount their paper on better terms than were given by the Presidency Banks to European firms of the highest standing, even on the security of Government paper. This remarkable divergence would seem to show that there is ground for the contention that the existing monetary scarcity is a scarcity felt more by European than by native trade, and that it is attributable to the fact that the Exchange Banks and their constituents have remitted home most of their capital owing to want of confidence in the future of the rupee, a sentiment which, of course, does not extend to the native banker. The money of Division 1 is not available for remittance homewards and does not affect the rate of exchange.

For the above reason Division 1 finds no place in the diagram, which purports to show the alternating effects upon the bank rate of Divisions 2 and 3. In this diagram the weekly statements of the three Presidency Banks are taken as practically showing the position of Division 2, since the balances, both of the Exchange Banks and of European traders, are, directly or indirectly, lodged with them. There is a small discrepancy between Division 2 and Division 3 and their corresponding bank balances and Treasury balances shown in the diagram. Division 2 includes the Government deposits with the Presidency Banks, because they are available for the purposes of commercial finance; but, in the diagram, these Government deposits are included in the Treasury balances to better illustrate the power which the Government has of controlling the money market. The amount of these Government deposits is shown by Table B to remain fairly constant at about three crores of rupees, hence the discrepancy between the divisions and the diagram does not materially weaken the argument that the Government really controls the Indian money market. Should it withdraw these three crores, with which, it would appear, the banks finance their customers, they would have to be replaced by importations of gold by the Exchange Banks. The deposits of Government with the Presidency Banks are not available for

remittance home, but they affect exchange by being employed in India, and so force away other loanable capital when discounts are low.

The amount of coin in the Government Treasuries (Division 3) rises and falls as taxes are collected and Imperial disbursements made. Such rise or fall is reflected in an *inverse* movement of Division 2. After the closure of the Mints the regularity of these movements was for long interfered with by

(*a*) The expenditure of the 11 crores of rupees locked up by the suspension of Council Bill Sales in 1893.

(*b*) The release of two crores from the Paper Currency Reserve at the close of 1896.

Since the completion of the last of these "watering" operations, however, it has been possible to note with greater accuracy the reflective movements of Divisions 2 and 3. As will be seen from the diagram, discounts rise and fall *directly* with the amount of coin in the Government Treasuries and *inversely* as the amount of money in the Presidency Banks. In other words, the Government Treasuries alternately absorb and release the loanable capital of Division 2.

Table C shows similar, though more varying, effects over a period of four years, as also the coincident rates of exchange. When the private deposits in the Presidency Banks fall below two crores, we see discounts rising to 10 per *cent.*: when the private deposits advance to 4½ crores, we see discounts falling to three per cent. or four per cent. These figures appear to show that a currency scheme which can affect directly and immediately these deposits (or in other words the amount of loanable capital at the service of the Presidency Banks) will offer the readiest and cheapest means of controlling the rates of discount and also of exchange, since the tendency of dear money is to raise exchange, and of cheap money to lower it. But as the Government deposits with the Presidency Banks are not remittable, the scheme only requires to provide for the movement of the remaining European loanable capital. As apparently this has not exceeded 4¾ crores in the past two years, a very moderate amount of gold should suffice.

On the other hand, from the fact that the native money market (Division 1) has not betrayed the extreme stringency which has characterised the European one (Division 2), it may be held that the scheme which is adopted should as far as possible guard against the danger of gold passing into the internal circulation, since the extent to which the silver money of Division 1 would be exchanged for gold coins is quite unknown, and cannot be measured by the very small depletion which, in the case of Division 2, suffices to produce stringency. If, then, this danger is to be avoided, the necessary control would be as effectively, and more cheaply, obtained by a scheme which substituted sterling drafts or gold bars for exportation for the issue of gold coins for internal circulation.

The fact that in the busy seasons of the past two years, all capital, both native and European, has been fully employed at good rates of discount, shows that there is no longer any appreciable surplus coinage in the country above its normal requirements; that even in the dull season the unemployed capital of Division 2 is small and can be easily dealt with, and that the necessity for melting down rupees, which would have been advantageous when the Mints were first closed, has now entirely disappeared. The trade of the country now requires more money rather than less, and it may fairly be argued from the foregoing that the melting down of rupees would only be a perpetuation of the policy which has induced the present stringency. Moreover, the scheme submitted by Government (which does not propose to substitute at first a circulation of gold coins for the rupees melted down) will reproduce the worst defect of the present system of currency, *viz.*:—a fixed *maximum* without a fixed *minimum* for the convertibility of the rupee. This defective feature of the present scheme has brought about certain methods of business based upon what may be termed "the evasion of the maximum." In other words, the fixing of 1*s.* 4*d.* as the convertible rate of the rupee in India, and of 1*s.* $4\frac{3}{32}$*d.* as the convertible rate against deposits of gold in England, amounts to a firm offer of rupees to all comers for all time at these rates. It is therefore clear that every banker or merchant, having such firm offer to fall back on, will exercise all his ingenuity to obtain his rupee requirements on better terms, and will only close with the Government's offer when all other means have failed him. This is the secret of the failure of the repeated attempts of the Secretary of State to fix a minimum for his Council Bills, for it is to be understood that the minimum of the Secretary of State is the maximum of the banker or merchant, and, as such, is evaded as long as possible. Each time that Exchange approaches this maximum, the export merchant ceases to sell bills, since he cannot sell them on worse terms, and may, by waiting, sell them on better, while the importer hastens to buy sterling in excess of his requirements, because he cannot lose, and may gain, by so doing. During the last two years exchange has again and again approached this maximum, only to recede almost immediately, from the effect of mercantile and banking operations such as are here described.

To remove this defect, the scheme which is adopted should provide a minimum remittance rate to all comers. The liability, as shown by the diagram, is small, seeing that the depletion of Division 2 by even so small a sum as two to three crores has an effect on discounts, which will speedily secure the return of the rupees to the circulation. It must, however, be urged that if the present monetary stringency is to be alleviated, the margin separating the maximum and minimum rates of convertibility should be a comparatively small one. Thus, if the margin be two per cent. as suggested in the Lindsay scheme, it should always be possible for the banks to obtain funds from England at two per cent. over the Bank of England rate, and consequently this margin would represent the extent of any monetary stringency in the Indian money market. Any scheme, however, which widens the margin between the maximum and minimum of convertibility, will tend to perpetuate the era of dear money in India. But a scheme like that proposed by the Government of India will neither beget confidence nor induce monetary ease, since its primary object is not convertibility assured by the Government, but a continuance of the policy of contraction, which has led to commercial difficulties, and has entirely failed to beget that spirit of confidence which, as Sir David Barbour pointed out in his Minute of 21st June, 1892, is essential to the success of the reform.

In conclusion, a word may be said with reference to the fears expressed as to the probable disturbance of the London money market owing to a large demand for gold by India. Table C. shows that at the beginning of 1894 (with the Treasury balances swollen by the cessation of Council Bill sales) the monetary position was much the same as now. Financial ease was induced in the interval by the release of 13 crores of rupees [representing unsold Council Bills and the lowering of the metallic reserve of the paper currency department], all of which have been absorbed by the country's requirements. The drain upon the European stock of gold, therefore, would not be of large extent if a fresh supply of 13 crores of currency in the space of four years has almost sufficed for the needs of India.

J. A. Anderson.
H. M. Ross.

Table A.

Comparing Rates of Discount charged by Native Bankers with Bank of Bengal Rates.

Native Bankers have no fixed rate of discount, but each transaction is a separate bargain, the charge varying with the standing of the drawers and endorsers and with the conditions of business. If things are going smoothly, small men get almost as good terms as wealthy ones, whilst threatenings of trouble cause a wide gap between the two. The usual accommodation is by Hoondies of 51 days' date, with two names. Hajarimal Sagarmal's business consists in discounting these Bills, whilst Mugniram Kunilal devotes his attention to making advances on shares and Government paper, &c., though to some extent also discounting Hoondies. Their rates may be taken as typical of the value of money amongst the native community in the past 18 months.

——	Hajarimal Sagarmal's Rates.	Mugniram Kunilal's Rates.	Bank of Bengal Rates.
1897.			
10 to 15 January -	6¾ @ 9%	7¼ @ 8½%	10%
15 „ 31 „ -	7 „ 4¾		
1 „ 14 February -	5 „ 5¾	7½ „ 9	10

1 „ 15 May - -	8 „ 9½	8 „ 9	11
15 „ 30 „ - -	6 „ 7	6 „ 7	11

These rates have also been compared with those shown in the books of Juggonath Gordundas, another Hoondie discounter. His rates are practically the same as shown above, except in July—August 1897, when he was charging his customers about 1 per cent. higher than the rates given above.

TABLE B.

Comparative Statement showing the amount of Government money as compared with private money in the three Presidency Banks as per the banks' statements on the following dates in 1898:—

——	Private.	Government.
	Crores.	Crore.
4th January - -	1·25	3·05
11th „ - -	1·29	2·68
18th „ - -	1·75	2·72
25th „ - -	1·63	1·63
1st February - -	1·70	2·72
8th „ - -	1·18	2·82
15th „ - -	1·19	2·96
22nd „ - -	·65	2·55
1st March - -	·81	2·80
8th „ - -	·46	2·95
15th „ - -	·93	3·18
22nd „ - -	·70	3·04
29th „ - -	·21	3·69
5th April -	·18	3·56
12th „ - -	— ·13 (minus)	3·51
19th „ - -	+ ·51	3·24
26th „ - -	·98	3·45
3rd May - -	1·07	3·53

From this it will be noted that Government money forms a large part of the loanable capital in the busy season. Without it in the past five months it would have been necessary to import gold largely to carry on the trade of the country.

TABLE C.

(1) Refers to balances in the Treasury, and (2) to private money in the Presidency Banks in crores of rupees.
(1) The Treasury balance includes the reserve balance and cash and notes of the public deposits with the Presidency Banks. (2) Amount in the hands of the Presidency Banks consists of the cash and notes after deducting the said public deposits. Position at end of each month:—

No. 31.

LETTER on BANK RATE and BAZAAR RATE in INDIA by Mr. JAMES H. SLEIGH, Secretary and Treasurer of the Bank of Bombay.

Reprinted from the "Times of India," 17th November, 1898.

To the Editor of "Capital," Calcutta.

SIR, Bombay, 12th November, 1898.

YOUR correspondent "Mercator," in his letter from Folkestone, dated 30th September last, reviewing some of the evidence given before the Currency Committee in London, does the Honourable Mr. Allan Arthur serious injustice in his criticism of the reply Mr. Arthur gave to Sir Henry Fowler's question No. 1735.

The question and answer run as follows: "Now "there is another point you have told us about—the "high bank rate. Has that rate been as high as the "discount in the bazaar?—No, my experience is that "the rate of discount in the Calcutta bazaar has not "been so high as the Bank rate. During the recent "period of stringency I know I had some bills to dis- "count, and I went and asked the rates for discounting "them, and I was quoted in the bazaar 8 per cent. I "was quoted by the Bank of Bengal 13½ per cent. I did "not discount the bills, but those are the quotations "that were given to me."

"Mercator" writes: "One can hardly understand "a British merchant uttering such arrant nonsense. "Why did not Mr. Arthur take bazaar money at 8 per "cent., and lend it out at once at a handsome profit on un- "doubted security, which he could certainly have done, "and conferred a benefit upon some of his brother mer- "chants, who had great difficulty in getting money at "any price? I have had 15 years' experience of intimate "relations with all the native bankers in the Calcutta "bazaar, and can confidently assert that with a tight "money market the Marwari banker will not underbid "the Bank of Bengal, for the very good reason that all "his agencies up-country are taking money from the "Bank of Bengal at full current rates. The Marwari, "however, will, when discount rates are on the de- "cline, lower his rates more rapidly than the Bank, but "these forward rates, never exceeding 2 per cent. "under Bank rate, are only for his own community, the "Marwari trader and banker, and not for the outsider, "whether native or European. Mr. Arthur appears "to be a very gullible person."

My experience, now extending over a period of 30 years, in the closest contact with the Indian money market, both in native and European circles, entirely corroborates the statement which "Mercator" so vehemently denounces. Surely no one doubts the veracity of Mr. Arthur's statement, and that one instance of actual experience is worth more than the theoretic deductions of a thousand Mercators!

During the last export season, Shroffs' 60 days' sight bills were not obtainable over 8 per cent. discount except to a very limited extent at some of the produce marts up-country where there might be difficulty in laying down money. This was the rate then ruling in the native bazaar both in Bombay and Calcutta, and that, too, while the Exchange Banks were greedy to receive fixed deposits for short periods at 9, 10, and even 11 per cent. per annum, and while the Presidency Banks were straining to meet the demands for loans at 12 and 13 per cent. per annum. But there is no singularity in these facts. The same peculiarity has shown itself over and over again during periods of financial pressure; and even at the present moment, while money is not by any means tight, there exists a difference of about 2 per cent. between the bazaar and the Presidency Bank's rates. I have ever found that when the official rate rose abnormally high the rate in the native market did not respond to the full extent, but generally stopped at 7 or 8 per cent., though the Presidency Banks' rate might rise to 10 or 12 per cent.

The explanation is simple! The Shroffs, who finance nearly the whole of the internal trade of India, rarely, if ever, discount European Paper and never purchase Foreign or Sterling bills. Neither do they lend money on Government Paper or similar securities, but confine their advances to the discount of *hoondees*, to loans to cultivators, and against gold and silver bullion. The *hoondees* they purchase are for the most part those of traders, small and large, at rates of discount ranging from 9 to 25 per cent. per annum, but the *hoondees* they buy from and sell to each other, which are chiefly the traders' *hoondees* bearing the Shroff's own endorsements, rule the rates in the native bazaar, and are generally negotiated, during the busy season, at from 5 to 8 per cent. discount. They also discount their endorsements pretty largely with the Presidency Banks when rates are low and discontinue doing so when they rise above 6 per cent. They also speculate largely at times in Government Paper, especially during the off season, but rarely or ever hold it or lend on it.

Their aggregate financial resources are very great, which, with their high credit and the elasticity of their system, enables them in times of severe stringency not only to continue but to increase their support to the internal trade of the whole country without the assistance of the Banks or experiencing any necessity to materially raise their rates of interest. They possess great facilities, too, for laying down funds in the Presidency towns by calling for remittances from their numerous agencies established in every Exchange centre in India, and are able to do so at rates much more favourable than at the same time obtain in Calcutta, Bombay, and Madras.

These are facts, and cannot, therefore, be disputed, so far at all events as their absolute truth is concerned. Hence the peculiarity of differential rates of interest and discount in India, and had "Mercator" taken the trouble to make proper inquiry he would have found it an easy task to discover the why and the wherefore.

"Mercator's" deductions would unquestionably hold good when applied to most of the Bourses of Europe, but Bombay and Calcutta are not in Europe! The Indian money markets possess very distinctive features and will probably retain them for many a year to come!

Mr. Allan Arthur, I know, is too shrewd and able a man of business to be ever likely to talk "arrant nonsense," or to say what is calculated to mislead.

Yours, &c.,
JAS. H. SLEIGH.

No. 32.

LETTER from COMMANDER HASTINGS BERKELEY, R.N., on the FOREIGN TRADE OF INDIA and a LOW RATE of EXCHANGE.

The Rookery, Headington, Oxford,
SIR, 1st November 1898.

I VENTURE, with much diffidence and in the briefest possible manner, to draw attention to certain fallacies of reasoning which appear to underlie the opinion that a low rate of exchange is a permanent stimulus to the foreign trade of India.

This view was brought very prominently before the Committee by several witnesses, and if there is any truth in it, its importance as a factor in fixing a par of exchange can hardly be exaggerated.

The gist of the argument, in a few words, appears to be as follows:—Under a low rate of exchange the seller of Indian goods receives for them a larger number of rupees than he does under a high rate. The increase of profit consequent upon this is cut out of the hands of the merchant, and of the middlemen generally, by the operation of the close competition which exists between them, and it therefore eventually finds its way into the hands of the cultivator, enabling him to extend his cultivation, and in turn to buy import goods more largely. Thus both the import and export trades are stimulated. (*See* Mr. S. Ralli's evidence, especially 5951. Also Sir F. F. Adam's, 7807.)

Sir D. Barbour pointed out (7945) the difficulty of explaining how a fall in exchange can permanently stimulate the international trade between two countries, since, if we consider the exchange in terms of both currencies, that which is a fall from one point of view is a rise from the other. Sir F. F. Adam admitted that "it is more or less of a conundrum that has to be "answered in this case from the Indian point of view" (7946). This, of course, is merely a restatement of the conundrum.

It will, I think, be found that the argument gradually crumbles away if, instead of assuming as a matter of course, that under a low rate of exchange the seller of Indian goods necessarily gets a larger number of rupees than he did under a high rate, we begin by questioning the validity of this assumption. It then becomes tolerably obvious that this assumption is valid or not, according to the character of the economical facts of which the fall in exchange is merely the exponent.

For what, after all, is the essential character of a rate of exchange between two currencies? Broadly

considered, it is simply an expression for the relative general purchasing powers of the two rated coins. Hence, if we exclude temporary fluctuations, any gradual and continued change in the rate is evidence of a change, and quantitative evidence of a change, in this *relation* of the two purchasing powers; but we must be particularly careful not to start any theory which includes the unexamined presumption that one or either of the rated coins has maintained unchanged its purchasing power, while that of the other has altered. Commonly, no doubt, a change in the purchasing power of both will be involved. For the purpose of illustration it will be sufficient to take two definite simple sets of conditions accompanying a fall in the Indian exchange: as (*a*) where this fall indicates or measures a fall in general purchasing power of the rupee, the purchasing power of the pound sterling remaining constant, and (*b*) where it measures a rise in the purchasing power of the pound, the purchasing power of the rupee remaining constant.

In case (*a*) it is quite clear that the same quantity and quality of Indian produce will command more rupees, but the argument that there is a greater profit on its sale is a *non sequitur*, since, whatever is gained in number of rupees is lost in their individual value, *i.e.*, in purchasing power. In case (*b*) where the purchasing power of the rupee has not altered, there can be no more rupees obtained than before, but the pound sterling will buy more than it formerly did. Thus in neither case is there, on *a priori* grounds, any logical validity in the view that a fall in exchange is in itself a source of increased profit to the Indian producer. It may, nevertheless, be necessary to modify this conclusion if we consider the matter in relation to the fixed charges borne by the Indian producer. We come here upon the apparently interminable controversy as to whether a fall in exchange is or is not in the nature of a bounty on Indian exports. It seems to be recognised that a fall in exchange cannot act as a permanent bounty, but while it is contended by some that such a fall acts at least as a temporary bounty, this is denied by others. The preceding considerations will show, I believe, that neither view is strictly correct. There is in each an element of truth, and this is probably the reason that agreement is difficult.

The mere fact of a fall in exchange, apart from any knowledge of the economical conditions which have brought it about, does not enable us to form a judgment. In order to form such judgment it is necessary to know whether the fall in exchange is due wholly or partly to a fall in the general purchasing power of the rupee. If so, then, the fixed charges borne by the producer remaining the same in rupees but being less in produce, there would be a *quasi* bounty; but if the fall in exchange is due entirely to an enhanced purchasing power of gold, the alleged bounty is mythical.

I am, Sir,
Your obedient Servant,
HASTINGS BERKELEY.

The Right Hon. the Chairman,
Indian Currency Committee.

No. 33.

MEMORANDUM by JOY GOBIND LAW, C.I.E., Member of the Legislative Council of the Governor-General of India, dated CALCUTTA, 27th August 1898.

I see the question has been raised as to the effect of Government currency measures on prices of Indian produce. It is a most difficult question. There are so many facts and circumstances which combine to govern prices, that it is almost impossible to predicate with any amount of certainty, of any particular variation in prices, that that was the result of the closure of the mints. It is conceivable that a sudden rise in exchange would have the effect of suspending for the moment purchases for European countries, but very soon things adjust themselves to the altered conditions, and either there is a fall in prices in the producing country, or a rise in the purchasing country; or, what is more usually the case, the difference is split and shared between the two. But, so far as my knowledge goes, there has been no permanent fall in the prices of Bengal exports owing to the contraction of the currency; nor is there any reason to suppose that trade has been crippled because of it, and there are no indications of such a catastrophe. The Bengal producer, mchajun or merchant, goes about his work without the slightest suspicion that the closing of the mints has had anything to do with fluctuations in prices, which, when they do occur, are rightly ascribed to the ordinary causes, demand and supply.

Much has been made of the losses which the poorer classes of the people have been put to, because of the appreciation of the rupee, in connection with the silver ornaments they were possessed of before 1893, but I have never heard of any serious or widespread complaints on this head; and, whatever their losses may have been at the commencement, it is undeniable they were not in operation since, and as they (the people) have been during the last few years in a position to secure a greater quantity of silver bullion for a given number of rupees than they ever were before, no doubt this has been a source of pleasure and enjoyment to them.

The greatest amount of opposition to the legislation of 1893 comes, it is true, from that important body, the European planters, but it appears to me there is a certain amount of misapprehension in regard to the effects of that legislation. They evidently seem to be under the impression that were it not for that measure they would be making immense profits on their productions. But does any one suppose that any permanent benefit would have accrued to them had exchange rates been lower than they have been? There is such a thing as competition, and competition would very soon have put an end to the extraordinary profits they imagine they could have secured. On the other hand, I cannot believe that the appreciated rupee has been of no advantage to them. Have they not to procure their machinery and stores from Europe? Would they not have to lay out a greater number of rupees to pay for them, had exchange dropped to 10*d.*, and have not some of them to remit their profits to England?

It must be admitted that the appreciation of the rupee affords a strong temptation to illicit coining, but I do not see that this is an insuperable difficulty. Currency notes have no intrinsic value, and the Indian Government have not found it impossible to detect and check forgeries.

In what I have said I am far from suggesting that there are no inconveniences or difficulties attachable to a currency with an artificial value. I believe there are several inconveniences and difficulties, but the question appears to me one of a balance of advantages, and considering the fact that no one is able to say with any amount of confidence how low silver might fall, closed mints were a necessity forced upon us by circumstances over which we had no control. I do not know whether those who are advocating free coinage of silver fully appreciate the consequences. It is said that some of the best mines could produce silver costing 6*d.* per rupee. Imagine, then, what our position would be if anything approaching this were realised. It would mean disaster and ruin to the Indian Government and people, and the total stoppage of all works of improvement. Some people say, put on additional taxes, but, as everyone knows, there is not much room for them. To tax the country further to any appreciable extent would be sure to cause serious discontent and suffering, and the Government, instead of being a blessing, would be universally execrated; and this is a danger which must be avoided at all hazards. It would be a clear advantage to the country if a gold standard could be introduced to clinch the measures already in operation.

Since the preceding remarks were written I learn from telegrams in the newspapers that some of the witnesses before the Currency Committee, who are advocates of the free coinage of silver, have made certain proposals to meet it, and amongst them I find they suggest the raising of the customs duties to 10 per cent., the doubling of the salt or income tax, the increasing of the railway rates, and export duty on jute. It appears to me that the advocates of these measures hardly realise how poor the people are. A tax on salt at five rupees a maund would almost put it out of the power of the poorer classes to buy this necessary of life, and would certainly lead to widespread discontent, and a big income tax would produce the same result amongst the taxable classes. A 10 per cent. duty on imports would mean that the people must considerably restrict themselves in the matter of clothing, which, as everybody knows, is scanty enough already. It must be noted that it is not the 10 per cent. duty alone that would produce this result. The serious drop in the exchange rates consequent on free mints must also be taken into consideration. It will perhaps be admitted that any large increase in railway rates would lead to a considerable curtailment of the passenger traffic, and to a certain extent of goods also. But, irrespective of other considerations, it seems that

in making their proposals the witnesses I have referred to lose sight of the economic objections to them. Their object is, no doubt, to foster the trade of the country, which they allege is being injuriously interfered with by currency measures, but I am unable to see how the trade of a country is likely to be fostered by burdening it with heavy imposts.

No. 34.

LETTER from Mr. DORABJEE PESTONJEE CAMA.

3, Great Winchester Street,
DEAR SIR, London, E.C., 10th November 1898.

REGRET I am not in a state to attend Indian Currency Committee meeting as requested by you of yesterday's date. I enclose a copy of a letter that I wrote to the Chamber of Commerce on 3rd October 1892. I am still of the same opinion as therein stated, and, if you wish, you can put it before the Committee.

I remain, Dear Sir,
Yours faithfully,
Robert Chalmers, Esq. D. P. CAMA.

Copy of letter enclosed with above.

To The SECRETARY of the CHAMBER of COMMERCE.

DEAR SIR, London, 3rd October 1892.

IN reply to our Chairman's letter of 29th September, *re* silver question, my humble opinion is that that question will not be settled, until all the leading governments agree to select a certain metal to buy and sell; if they do not come to any arrangement, then the silver-using countries will continue to prosper by exporting their produce, and, as far as possible, manufacture what they import, which means ruin to the industry of gold currency country. When silver is at 39*d.* and rupee at 1*s.* 3*d.*, wheat sells at 30*s.* If India were to make the gold currency, a rupee ought to be 2*s.* (I have seen the exchange at 2*s.* 3*d.*), and when the exchange be at par, then India will not be able to sell wheat under 48*s.* If India keeps silver currency, silver by degrees will knock down the rupee, and I should not be surprised to see a rupee equal to a penny, in which case India can sell wheat at 2*s.*, instead of now selling it at 30*s.* Although, in fact, I am personally a sufferer, owing to depreciation of the rupee, I wish the Indian Government would not introduce gold currency in India, for the welfare of the country.

Yours faithfully,
D. P. CAMA.

No. 35.

LETTER from Messrs. RALLI BROTHERS, forwarding STATISTICS mainly relating to the COTTON TRADE (with Diagram).

25, Finsbury Circus, London, E.C.,
DEAR SIR, 11th November 1898.

I AM in receipt of the letter which you have written to me under date of 9th November on behalf of the Right Hon. Sir Henry H. Fowler, Chairman of the Indian Currency Committee, asking me whether I desire to be recalled as a witness to supplement the evidence given by me on 11th July last.

Having read the evidence of Mr. J. E. O'Conor, page 53 of the Minutes of Evidence taken before your Committee, No. 1416, I wrote to our Manchester firm, Messrs. Ralli Brothers, to prepare, if they can do so, a statement giving the official exports from the United Kingdom to India, of cotton goods for each year beginning 1873 and ending 1897. This work has taken a good deal of time. Some statements and charts were sent to me some time ago by our said firm, and I asked them to have them submitted to Mr. W. H. Holland, Sir Forbes Adam, and Mr. Barclay, Sir John Muir's agent in Manchester. I afterwards wrote to our Manchester firm to have copies of these statements and charts forwarded to Sir John Muir in Glasgow, and to my friend Mr. Robert Campbell, General Manager of the National Bank of India, with whom I had some conversations respecting them. I have since asked our Manchester firm to give us, if possible, the amount of production of the Bombay cotton mills in 1873 and 1897, which is a very important feature, and after ascertaining this, to send to the chairman and members of the Committee and to yourself copies of these statements and charts with the above additional information.

ON receipt yesterday of your letter under date of 9th November, I sent copy of same to our Manchester firm, asking them if they have not yet been able to get the information about the production of the Bombay cotton mills, to send to you 12 copies of the above-mentioned documents and charts, and not to wait any longer.

As regards my giving further evidence, the most important point is the above. There are also other points on which I could give evidence, but they are of secondary importance and will not affect the main issue, and from the reading of the blue book some of them have been already answered by other witnesses, and I have no doubt some others will be answered by the new witnesses which will be examined. Therefore while thanking the chairman and the members of the Committee for the opportunity given to me, I shall not avail myself of their kindness, and I shall not take up more of the Committee's valuable time.

Believe me, &c.
S. A. RALLI.

Robert Chalmers, Esq.,
Secretary Indian Currency Committee,
India Office, Whitehall, S.W.

STATEMENTS, &c. referred to in the foregoing LETTER.

(A.)

No. 36.

EXTRACTS from the REPORTS of TEA COMPANIES for the SEASON 1897.

(*Handed in by Mr. D. Cruickshank. See Q. No.* 9408.)

The Chandpore Tea Company, Limited (Sylhet).

"The result of the season is very disappointing, but the reasons are evident. First, the unfavourable weather, as stated above; second, the rise in exchange, 1*d.* being equivalent to a loss of over 600*l.* on the working of the garden."

The Majuli Tea Company, Limited.

"The difference in the cost of remittance for the working expenses in India, amounting to 2,196*l.*, is a serious item, equal to over 2 per cent. on the capital of the Company.

Attaree Khat Tea Company, Limited.

"Fortunately the loss by the higher rate of exchange has been considerably minimised by the directors having arranged beforehand for the bulk of the year's requirements at 1*s.* 2½*d.* exchange. It will be obvious how materially our position would have been affected if it had been necessary to provide funds at the current rate of about 1*s.* 4*d.*"

The Allynugger Tea Company, Limited.

"Unusual and serious difficulties have handicapped the industry, foremost amongst them being the high rate of exchange."

The Brahmapootra Tea Company, Limited.

"The directors regret the increased expenditure which the circumstances of the season have necessitated, and which has been seriously aggravated by the policy of the Government in artificially enhancing the sterling cost of the rupee."

The Dejoo Tea Company, Limited.

"The increase in the cost is accounted for by the short crop, heavy expenses for labour importation, higher rate of exchange."

The Assam Company.

"The circumstance that the Indian Government have been able to maintain the value of the rupee during the year at the level of about 1*s.* 4*d.*, has had the effect of considerably diminishing our profits, in common with those of all tea companies and other industries carried on in India with British capital."

The Borelli Tea Company, Limited.

"The high rate of exchange has seriously affected the working of the year."

The Chargola Tea Association, Limited.

"Exchange has again ruled higher and increased the cost of production by about 2,000*l.*, or, say, ¼*d.* per lb. The rise of the past two years in the value of the rupee means the loss of a sum equivalent to 5½ per cent. on the ordinary shares."

The East India and Ceylon Tea Company, Limited.

"The directors regret that the higher rate of exchange, the fall in the price of tea, and the enhanced cost of rice owing to the Indian famine, have reduced the profit of the year. The rise in the exchange alone during the past year, raised the cost of production ¼*d.* per lb., and is caused by the action of the Indian Government in artificially forcing up the value of the rupee."

Endogram Tea Company, Limited.

"The cost of the tea, including all expenditure chargeable to the year, was 6½*d.* per lb., the sterling cost of production being considerably enhanced by the rise in the Indian exchange."

The Lebong Tea Company, Limited.

"The average rate of exchange for the remittances of the year was 1*s.* 3*d.*, or ½*d.* more than last year. While, therefore, compared with the experience of others, the result is considered satisfactory, the reduced outturn, lower prices, and higher exchange combined have the effect of considerably reducing the profits from the figures of the last very prosperous years: Thus, 1896, nett profits = 12,682*l.*; 1897, net profits = 8,444*l.*

The Eastern Assam Company, Limited.

"The cost of production was high; 1$\frac{1}{16}$*d.* per lb. of this is accounted for by the higher exchange as compared with 1896."

The Empire of India and Ceylon Tea Company, Limited.

"During the year under review there has been a further rise in the exchange value of the rupee, which has helped to reduce profits."

The Assam Frontier Tea Company, Limited.

"The rate of exchange ruled about 1*d.* per rupee higher in 1897 than it did in 1896, and this is equal to a loss to the company of over 6,500*l.*"

The Lukwah Tea Company, Limited.

"The Company has, in common with other producing concerns in India, suffered during the past from the rise in the exchange value of the rupee, and should exchange be maintained at the artificial rate of 1*s.* 4*d.*, the adverse effect on the company's outlay will have to be reckoned with in future."

The Moabund Tea Company, Limited.

"Exchange ruled higher than in the previous year, and the cost of remitting the working expenses to India has thus been increased by 3,084*l.* in excess of the sum necessary to provide the same amount of rupees at rates obtained in 1896."

The British Indian Tea Company, Limited.

"The increase of 2,500*l.* in the estimate of the expenditure, as compared with the figures of 1896–97, is owing to the higher rate of exchange (1*s.* 4*d.* per rupee) entered this year."

The Jokai (Assam) Tea Company, Limited.

"The action of the Government of India in closing the mints, and thereby artificially raising the sterling exchange value of the rupee has added materially to the Indian expenditure; the loss in 1897, as compared with that of the previous year, amounted to 3,542*l.*, which would have been considerably increased but for the fact that the board had fixed exchange forward for the bulk of the Indian outlay to the 31st March last at 1*s.* 2½*d.* The difference on exchange for the current year, taking the rate at 1*s.* 4*d.*, will amount to 17,532*l.*, as compared with the company's average in 1895, or equal to 7 per cent. on the ordinary capital of the company. With the above facts of this particular case before them, shareholders will realise what the expense will be to the Indian producers generally, if the Government proposal to introduce a gold standard is carried out."

No. 37.

MEMORANDUM by Captain EDWARD FRERE MARRIOTT, I.S.C.

Of those issues which the Currency Committee has assembled to consider, which is the first and foremost on which it must pronounce? It is this: which of two possible currency policies would India be wise to adopt? Gold or silver monometallism?

To this issue alone I propose to address myself; for the argument in favour of silver monometallism as a currency policy for India is, to my mind, overwhelming.

What is it that more than aught else has driven the Government of India for years to seek a change from her silver standard policy? The belief, fostered by the pioneers of this question, that silver has for years been falling steadily in value,* and that it has become so untrustworthy as to be unfitted for its position as a standard. Is it strange that so false a belief has, as yet, but led to currency chaos?

I have written a small pamphlet, "The Indian Currency Question," published by Messrs. Kegan, Paul, Trench, Trübner & Co., in which I prove incontestably both that gold appreciated some 47 per cent. in 1892 as compared with its average value in 1867–77; and that silver in 1892 was of the same level of value as in 1873, and that, in the intervening period, it had neither risen nor fallen to any notable extent. There is nothing new in the theory of gold appreciation and silver stability. All single-minded students of the question whom I have met accept it; but the pamphlet should be useful to those who have not specially studied this aspect of the subject, or who, having studied it, are yet led by such an authority as Lord Farrer to deny the theory.

I need not here touch on the proofs of the appreciation of gold; but I may usefully put forward some arguments which prove the truth of silver stability.

I may point out that, if gold has been proved to have risen in 1893 some 47 per cent. in value above the average level of 1867–77, and if silver in the same period fell, as it did, 32 per cent. in price, the stability of the value of silver is thereby proved.† Inasmuch, however, as the truth or otherwise of the stability of silver between 1873 and 1893 is of great importance, I advance the following proofs of the matter.

In the year 1894 I was considering this question, and I chanced upon some tables of silver prices in China drawn up by Consul Jamieson, of Shanghai, and furnished to the Foreign Office in a report, "Miscellaneous Series," No. 305. From these tables I drew up and published silver index numbers of the prices of 43 commodities for the years 1882–92 inclusive; the average prices of the years 1870–74 were my standard of comparison, and these prices I represented by the number 100. The result was as follows:—

1870–74	100	1887	95·5
1882	96·1	1888	97·2
1883	99·4	1889	96·8
1884	92·4	1890	100·4
1885	92	1891	94·5
1886	100·1	1892	96·9

These figures give an average index number of 96·5, or a value for silver for the period in question of 3·5 above the level of 1870–74.

In the year 1896 Mr. Atkinson, of the Finance Department of India, who has drawn up many useful tables of prices, furnished the following figures to "The Pioneer." They are the export prices in India of certain commodities, and they are compared with the prices of the same commodities in 1871:—

1871	100	1887	92·7
1882–83	98·9	1888	95·9
1883	92·7	1889	99·6
1884	94·5	1890	103·9
1885	94·6	1891	98·2
1886	92·9	1892	100·4

These figures give an average index number of 96·8, or a value for silver, for the period in question, of 3·2 above the level of 1871.

The second corroboration of the general correctness of the index numbers which I obtained from prices in China is to be found in the third edition of Sir G. Molesworth's prize essay, "Silver and Gold," in which a diagram based on Soetbeer's Tables occurs. In this diagram we have gold and silver measured by a multiple, that is, an ideal standard; 114 commodities form this measure, and their average level is shown by a thick horizontal line. Arrays of figures may fail to

---

* Value in its correct economical sense, *i.e.*, commodity value.

† The actual figures are instructive. Gold prices fell from an average of 100 in 1867–77 to 68 in 1892, a fall of 32 per cent. The price of silver fell from 58*d.* in 1867–77 to 39¾*d.* in 1892, a fall of 31½ per cent. The price of silver, therefore, fell almost exactly with the average price of commodities; in other words, silver remained perfectly stable in value up to 1892; and yet in that year the Government of India began to vehemently agitate for the overthrow of this most perfect standard of value.

carry conviction, but no one who has once glanced at this diagram and seen the gold line climbing alof , while the silver line clings round this ideal level of value, can fail to be impressed by the fact of the appreciation of gold and the stability of silver during the period dealt with.

I do not wish to deny that India ever since 1873, has had certain financial troubles to contend with; yet, considering with what really remarkable ease* the country met these troubles, we can never with justice consider that India was at any time on the verge of bankruptcy, or was ever in such financial ill-health as to require heroic remedies.

To what were these troubles due? The chief cause of her financial difficulties, and the one which dwarfed all others, was the rise in the value of gold, the rise, that is, in the value of the sterling measure of her indebtedness. From 1873 onwards all gold debtors had alike been bearing continually increasing burdens. Gold debtors, whether discharging their debts through gold or silver, have been suffering each to an equal extent, but it was only those who discharged debts through silver who were in a position to see the increase of the weight of the burden which they bore. The increase of the burden in the case of India was marked by the fall in the price of the rupee; but the fall in the price of the rupee was no more the cause of the increasing burden than the fall in the price of cotton in India, or of wool in Australia, was the cause of the increase in the burden of those gold-debtor countries; yet, on this fall in the price of the rupee have all eyes been fixed, as if it, and it alone, were the disease, and to cope with this imaginary disease has been the aim of recent legislation.

Now, I fully allow that the burden was heavy; indeed, had gold continued rising in value, gold debtors must in time have been compelled to repudiate a portion of their debts, and they would have been quite justified in doing so. But the burden in India was not due to a fall in the value of the rupee; and this is a point to bear clearly in mind.

The difficulty, then, which India had to face in 1893, in common with all gold debtors in the world, was the rise in the value of the sterling measure of her indebtedness. But this real difficulty was obscured by the all too evident fact of the fall of the rupee in price; this fall was regarded as the real source of difficulty, and this phantom trouble led minds to ignore the true issues.

There are those who would argue that, as far as India is concerned, it mattered little whether gold had risen or silver fallen in value. Such an argument is untenable. As far as India is concerned—as far, that is, as her power of meeting her debts is concerned—the value of her currency is of no importance whatever. India discharges her debt by the export of surplus produce. She has no surplus produce of silver; all the silver in the country has been imported by those who needed it either for currency, hoarding, or manufactures, and it is only by the exports of surplus produce that India can meet her debts. If it had been silver which had fallen in value, and gold which had remained stable, India would have had no added burden to meet. The debtor's measure of indebtedness is, in this connexion, of no account; it is clearly the value of the creditor's measure of indebtedness which alone affects the burden of debt.

Again, there are those who argue that as far as the Government of India is concerned it is of no consequence whether gold has risen or silver fallen in value. As regards the narrow question of the balances of Government ledgers, the argument can pass; but it is impossible to satisfactorily treat this great, if simple, question by peering through the narrow channel bounded by Government ledgers.

It is hard to conceive how mischievous to the controversy the false theory of the depreciation of silver has been. This parent error has given birth to many children; but the most misleading of the whole brood is the one which has induced a belief in the worthlessness of silver as a standard value, and has led India to agitate for its dethronement.

Mr. Dunning Macleod's latest pamphlet on the Indian currency is rendered futile by his adherence to this monstrous superstition. He writes of India's adoption of a silver standard as a matter of regret, and her final refusal of gold as a calamity. When shall we clearly understand that, until legislation was directed against silver, India possessed the most perfect standard of value in the world, and a medium of exchange exactly suited to her requirements? One writer only on these subjects has, as far as I know, fully recognised this, and I may be permitted to quote his wise words. Mr. Lloyd, in *The Statist*, of the 6th August last, in considering the question as to who gains and who loses by a fall in exchange, wrote:—"The stimulus, then, to the "Indian export trade and to Indian production, was "given by the steadiness of the value of silver, at a "time when gold was rising so much in purchasing "power. In other words, India benefited from the "excellence of her own currency system."*

If we set out from the starting point of gold appreciation and silver stability we can arrive at but one solution of the Indian currency problem, and the solution is to return to free silver monometallism under which India flourished greatly.

Before the fatal 26th June, 1893, India, thanks chiefly to her admirable currency conditions, and in spite of the growing burden of her sterling debt, was enjoying a fair measure of prosperity. But in one part of the horizon a cloud lay, and the rulers of India were oppressed with a sense of coming disaster. This cloud had begun to form in 1873, and had been continually growing larger; it threw a shadow over gold-debtor nations, and shed a depressing influence over gold-using countries. But its nature remained for long unrecognised. Silver countries saw their currencies falling apparently in value, and attributed the phenomenon to the depreciation of silver caused by the increasing supplies of that metal. Gold-currency countries attributed the oppression to over-production, strikes, and other imaginary causes. But the increased demand for gold, and the consequent contraction of the gold currency, was the one sinister influence affecting all alike. Yet so blind are the nations even now to the real cause of their troubles, that many of them, following the example set by India, are joining in the scramble for gold, and are thereby intensifying the evils from which they suffer. If the problem were rightly understood, and if India and the countries which have followed her example were to avoid the further use of gold, they would see the cloud which menaces the future melting away before the greatly increasing supply of gold which this decade is witnessing. The day, indeed, of the discovery of the Witwatersrandt Goldfields was the beginning of the end of the currency troubles which have been threatening the civilised world.

Such is a true presentment of the problem, and the evident solution of it for India is to return to her old established silver monometallic policy; to avoid, as far as possible the use of gold, and to allow the enormously increased and increasing supplies of gold to have their natural effect in gradually lowering its value.

India, then, should repeal the legislation of 1893, and should let a free and elastic currency once more circulate through her arteries. Under such conditions silver would approximate to the level it held in 1893 just before the mints were closed;† trade and commerce moreover would so flourish, that the expanding revenues would, I doubt not, meet the additional rupee expenditure which would be required. But if even then some further taxation were found necessary, surely a scheme for increasing the revenues could be devised less injurious to the country than one which strangles commerce, stifles trade, and tends to throw the country back into the barbarous condition where money is unknown, and transactions are the subject of barter.

Under the silver depreciation theory it is very generally held that a return to open mints would mean

* The year 1892 was the fourth of a series of years of uninterrupted surpluses.

* I should add that Mr. M. de P. Webb, in an admirable article in the "Bimetallist" for July, 1898, has also recognised, and has forcibly insisted on this economical truth.

† At the beginning of 1898 the Japanese currency legislation was held to be a bar to a return to open mints in India, for it was argued, and justly, that while this legislation continued the rupee could not rise above 11*d*. Mr. A. M. Lindsay, in speaking to me on the subject laid stress on this point, and I understood him to say that, but for Japanese legislation, he would look on a return to open mints as the preferable policy. Now this legislation, as a measure affecting the position of silver, is dead. The yen ceased to be legal tender on the 31st March 1898, and ceased to be exchangeable for gold, under the Act, on the 31st July 1898; a most important consideration.

a fall of the rupee to 9*d.* or lower, and in the end a practically unlimited fall.

Knowing, as we do, that the fall of the rupee in gold price was, up to 1893, due solely to the rise in the value of gold, and that, until legislation was directed against it, silver never fell notably in value, we may rightly conclude that a return to the currency conditions which ruled before 1893, would imply a return to silver stability, and that the level of the value of gold would again be practically the sole factor in the change of the gold price of the rupee. And since such a policy would imply the cessation in the prospective demand for gold, and since this policy would sooner or later be followed by all would-be gold standard countries, it would have a world-wide effect in lowering the demand for gold, and gold would fall in value and the rupee rise in price; and year by year the revenues of India under a free and elastic currency policy would expand, and her expenditure as the gold burden grew less would diminish, and the country would enter upon an era of great prosperity.

Prosperity immediate and increasing would be the certain reward of the acceptance of the simple policy, I, and those who think with me, advocate. What have the advocates of gold monometallism to offer? A great initial expenditure, an increase in the amount of the sterling debt, and an increase in the weight of the whole burden of debt due to the increased value of gold which the demand by India for gold would lead to; several years of money scarcity,* dear capital, stringent markets, and currency conditions adverse to the increase of commercial enterprises, and to the general prosperity of the country, and all to secure a standard of value less stable than silver, and less suited to India's needs.

It was the growth in the value of gold which alone caused the pressure of expenditure to be felt in India for so many years; it was this growth which caused the rupee to seem to be ever growing less and less in value, and which led the Government to devise schemes to prevent its continuous fall; but this growth has now ceased, and Sauerbeck's index numbers proclaim that a slow and teady fall in the value of gold has begun.

It is interesting to see what a great financier has to say in regard to this increasing supply of gold. On page 253 of Part I. of the Minutes of Evidence this witness says:—"You would do a service to Europe if "you were to gradually utilise this extraordinary "surplus of gold." The witness means that India would do a service to the gold creditors of Europe; that is true, but India would be doing a great disservice to herself, and to every other gold debtor in the world. Such evidence as this from such a source points unmistakably to the road India should take. *The course which the gold creditor would take is the one which the gold debtor should carefully avoid.* India must legislate with a single eye to her own interests; she cannot pause to consider the interests of gold creditors who are likely to suffer to some extent by the fall in the value of gold which is impending.

It is unnecessary to point out to the advocates of gold monometallism the difficulties, and even dangers, attendant on the adoption of a gold standard for India. For one thing, the huge initial cost of obtaining gold must be faced, and cannot, as Lord Rothschild points out, be avoided by any currency scheme, however skilfully devised.

And, for those who understand that stability is the one prominent virtue in a standard, and who recognise that silver possesses this virtue in an unusual degree, the question before the Currency Committee is answered. Silver has long been accepted by the millions of India as a medium of exchange suitable to their needs; if, in addition, it possesses the stability required in a standard of value, then there is no commodity in the world which could with advantage take its place in India.

My arguments in favour of silver monometallism for India are as follows, each of the following propositions are, to my mind, of more weight on the side of a silver standard than any which the gold standard advocate can produce:—

(1.) Silver, until the passing of the adverse legislation of 1893, was stable in value, and therefore prominently fitted to India's needs, both as a standard and a medium of exchange.

(2.) The increase in the value of gold between 1873 and 1893 was alone responsible for the increase in the burden of indebtedness which India bore, and silver was innocent of blame.

(3.) The value of gold, according to Sauerbeck's index numbers, is even now ebbing, and would most certainly fall more rapidly if India withdrew from the gates of the gold market, a fall which would proportionately lighten India's gold burden.

(4.) The adoption of a gold standard, in itself a most costly and burdensome policy, would necessarily tend to increase the real burden of the sterling debt.

(5.) A rupee forced above its natural silver level must injuriously affect export trade, the trade, that is, on which the real prosperity of a country depends.

(6.) A rupee at its natural level, destined to rise in price as gold falls in value, would be at least as attractive to western capital as any other currency policy which could be devised.

The advantages of gold monometallism are almost entirely imaginary. I have never met but one argument in its favour which is really worth consideration. It is urged that linking India's currency system with that of England would encourage the flow of western capital to India. It would do so, but so would any fixed currency policy; and nothing could better promote the flow of capital than the conditions which would rule under a return to silver monometallism. For were the legislation of 1893 repealed, the rupee would fall to a fixed level, and inasmuch as the repeal would deal a deadly blow at gold ascendancy and limit the possible demand for gold, we should certainly see its value, under constantly increasing supplies, falling, gradually falling, no doubt, but still falling in value, and this implies a rise in the price of the rupee. The conditions of a rising rupee would plainly be very favourable for the attraction of western capital.

A return to open mints should alarm no one. If the Secretary of State were to press the sales of council bills, the rupee would gradually fall until it reached a price of, say 1s. 2*d.* If, then, the mints were re-opened to silver, silver would rise considerably, and the rupee fall slightly, until an equilibrium were reached, which would be at about 35*d.* an ounce for silver, and 1s. 1$\frac{1}{2}$*d.* for the rupee (*vide* note). The disturbance to trade even in the silver market would not be great, and certainly no greater than that occasioned by the passing of the currency legislation of 1893.

When we have once grasped the fact that silver is an admirable standard of value, we could never, I think, agitate for its dethronement; and when we have once recognised that the adoption of a gold standard must increase the value of gold, and, *pro tanto*, the weight of the burden of the sterling debt, we could never, I think, be so unwise as to enthrone gold as the standard of value for India.

EDWARD FRERE MARRIOTT.

Athenæum Club, Pall Mall, S.W.,
10th December, 1898.

NOTE.—To what level would the rupee fall if the mints were re-opened? This question is of great importance to the Indian Government, but I have seen no reasoned answer to it. Vague suppositions that the rupee would fall to 9*d.* or even lower, float about; but these are but the offspring of the parent error, the depreciation of silver. Let us examine the question.

The price of the rupee, when the mints are open, depends on two factors—the value of gold, and the value of silver. The value of gold we can, with the help of index numbers, determine with some exactness. It stands abour 4 per cent. higher than in May 1893, just before the mints were closed. The value of silver is not so easily determined, but it depends, in the long run, like every other commodity, on the cost of production, supply and demand. The cost of production, in spite of some advance in the treatment of refractory ores, is practically unchanged, and the supply of silver has scarcely altered. The conditions of demand alone have changed, but the change is due chiefly to the Indian legislation. Let India repeal this legislation, and the conditions which made for the value of silver in May, 1893, would be practically restored. If, there-

* It would naturally take some years to establish a gold "currency." Lord Rothschild, Minutes of Evidence, p. 286, Pt. I.

fore, the mints were re-opened, silver, owing to the higher value of gold, would be some 4 per cent. lower in price than in May, 1893, and would probably stand at about 36*d*. I do not think that silver, if it again were freely coined in India, could rise to less than 35*d*. an ounce, and this means a price for the rupee of 1*s*. $1\frac{7}{16}$*d*.

I would ask those who hold that, on the mints being opened, the rupee might fall to 10*d*. or lower, whether this fall is to come about owing to (1) a rise in the value of gold, or to (2) a fall in the value of silver. If to (1), I would ask how mints open to silver can increase the value of gold; if to (2), I would ask how increased facilities for the flow of silver can lower the value of silver. It is clear, of course, that open mints would lead to a considerable rise in the value of silver; and to me it seems self-evident that the rise would reach a level approximating to that held by silver in May, 1893, before the mints were closed; and it is unquestionable that, with mints open to the free coinage of silver, the price of silver and of the rupee would, year by year, steadily rise as gold, under the pressure of "this extraordinary surplus of gold" gradually falls in value.

No. 38.

MEMORIAL FROM WEST OF SCOTLAND MANUFACTURERS.

SIR, 17th December, 1898.

WE, the undersigned manufacturers, in the West of Scotland, of cotton and other goods for the Indian markets, desire to put a brief statement before your Committee, showing the effects of exchange fluctuations upon our trade.

We have some reluctance in doing so, but we note from the Blue Book, recently published, that evidence has been given, not only by export and import merchants dealing with India, but also by the tea producers there; while the British manufacturer of goods for the Indian markets has not been represented.

We desire to draw your attention to the following points:—

A. The point brought out by Sir Francis Mowatt (Questions 4290/91 of the Blue Book, Indian Currency Committee, 1898), that it is the producer in India, and the producer in this country, who are properly comparable, is of much importance, as showing that the latter is equally entitled with the former to a fair share of consideration.

B. The unlimited coining of depreciating silver from 1874 to 1893 for all comers, and the consequent fall in the basis of exchange, had a serious effect upon British industries. The extra rupees required to cover the sterling costs were often not to be obtained, or if obtained, it was only after a prolonged delay—the result being that the British manufacturer had frequently to work without profit and often at a loss.

While on this point, we would call your attention to question and answer 6110 of the Blue Book, in which it is stated that Glasgow and Manchester exporters do not require to enter into any transactions unless they choose. This may be the case of the merchant, but the manufacturer, whose machinery is adapted chiefly for the Indian trade, must continue producing, even at considerable loss, rather than face the complete stoppage of his mills or dyeworks, and the disbanding of his trained employees.

Further, when exchange is fluctuating, the Indian buyer, who cannot foresee the rate of exchange at which payment will be made, is chary of making sterling purchases of goods which cannot be delivered for many months to come.

But if he does make such a purchase, and finds, on coming to pay the price, that the exchange has gone against him, and that he has to remit more rupees than he contemplated when he placed the order, he frequently finds some means of repudiating his purchase, with the result that the British producer becomes a heavy loser.

If any actual proof of the effects of exchange upon our trade were required, we could show (1) that the years of a low or falling rupee were years of restricted output and unprofitable business; (2) that, with the gradual rise of the rupee since 1895, a decided improvement set in, and that, too, in spite of war, plague, and famine in India; and (3) that, in particular, we have benefited by the steadiness of the rupee during the present year.

C. It seems to us that the view put forward, before your Committee, by some advocates of open mints—viz., that India has benefited by a falling exchange, and that the more the currency of a country depreciates, so much the more does its productive power increase—is a most fallacious one, and opposed to all experience. We submit that the strong standard countries are the best producers and exporters, and in India itself, in the years prior to 1874, when exchange was about 2*s*., the average yearly increase in exports, reduced into sterling at the current exchange, was larger than it has been under the declining rupee. We believe that a stable exchange is necessary to secure the proper development of trade in India, and also to gain the confidence of the capitalist to invest there. On this point we beg to refer you to the accompanying statement, prepared by a competent authority, of the statistics of Indian trade for the past forty-one years.

D. We note that one of the suggestions of the open mint advocates, in order to meet the increased taxation which would be necessary were the mints re-opened, is to increase the import duties. Against any such increase we would respectfully protest.

E. In conclusion, we would venture to express our agreement with Sir Samuel Montagu (Blue Book 6627), that it "would be the height of "folly to have the Indian mints alone opened, "and no other mints, either in the old or the "new world."

We believe that the Government of India, in adhering strenuously to the recommendations of the Herschell Committee, as given effect to in their currency policy since June, 1893, with such further measures as may appear desirable for strengthening and establishing that policy, would be acting for the best interests of all who have business connections with India either as exporters or importers.

To the Right Honourable
Sir Henry H. Fowler, G.C.S.I., M.P.,
Chairman of the Indian Currency Committee.

From Messrs. GEORGE WILSON & Co., Dalmarnock Weaving Factory, Glasgow.

DEAR SIR, 22nd February 1899.

HAVING seen the memorial addressed to Sir Henry Fowler, as Chairman of the Indian Currency Committee, by 15 firms in this neighbourhood, dated 17th December last, we desire to add our name thereto.

We are proprietors of four large cotton mills, and have had extensive business with India for the last 30 years.

We are, &c.,
GEORGE WILSON & Co.

Robert Chalmers, Esq

STATEMENT accompanying above MEMORIAL.

INDIAN TRADE, &c.—41 years—1857-8 to 1897-8.

1. The Table below is specially prepared to show the sterling equivalents, at the varying rates of exchange, of the merchandise and treasure, imported and exported, during the last 41 years, in order to rectify many wrong deductions that have been made by comparing rupee figures, at a lower exchange, with rupee figures at a higher.

2. The general result, as regards exports of merchandise, is that in the 15 years prior to 1872, when exchange ranged round about 2*s*., exports increased steadily from the equivalent of $27\frac{5}{10}$ millions sterling to $63\frac{2}{10}$ millions sterling, *or at the average rate of* $2\frac{1}{2}$ *millions sterling yearly*. In this period the 3 years, 1863–6, are exceptional, the increased value of about 18 millions sterling, yearly, being mainly due to the very high prices of cotton caused by the American Secession War; but, apart from this, there was a steady average yearly increase of $2\frac{1}{2}$ millions. Had this increase continued at the same ratio during the last 26 years of declining exchange, *the exports would now have amounted to the equivalent of* 128 *millions instead of* $64\frac{1}{10}$ *millions last year*. This fact completely disposes of the popular fallacy that a depreciating currency enriches a country by promoting production and increasing exports. The reverse is the true state of the case. As an instance, the paper currency of the Argentine Republic, which stood relatively to gold at 361 premium in 1891, equal in sterling to only $10\frac{5}{16}d$. per currency dollar, has since steadily and gradually improved until now the premium on gold is reduced to about 125, or the equivalent in sterling of 1*s*. 9*d*. per currency dollar; and this advance in the value of the currency, from $10\frac{5}{16}d$. to 1*s*. 9*d*. per dollar, has been attended by the best general results to the trade and prosperity of that country. Further, it is a matter of common knowledge, that, all over the world, the countries with strong and stable exchanges are the largest exporters.

3. Another striking feature is that, when exchange begins to decline, the sterling equivalents of exports fall off. This will be noticed by comparing 1871–2 with 1873–4, 1877–8 with 1879–9, 1883–4 with 1884–5, 1891–2 with 1892–3, 1893–4 with 1894–5. This shows that, on a fall in exchange, rupee prices, as a whole, do not, *at once*, obtain an equal equivalent rise; that there is first the higgle-haggle of the market, depending mainly on the position of each article, and, so long as this equivalent rise is not obtained, the produce growers suffer from the fall in the rupee, and the exports are less effective for taking off Council drawings and imports. On the other hand, it will be noticed that the greatest increase in exports, during the past 26 years, was in the 6 years 1878–9 to 1883–4, while exchange kept fairly steady at 1*s*. 8*d*. and 1*s*. $7\frac{3}{4}d$. During these 6 years exports increased from $50\frac{8}{10}$ millions to $72\frac{5}{10}$ millions, an average of $3\frac{1}{2}$ millions sterling yearly. The true inference from all this seems to be that, while exchange is declining, produce growers do not *immediately* get the equivalent of the decline in advanced rupee prices; that, while it is advancing, they have not *immediately* to concede the equivalent of the advance; so that an advancing exchange is for the benefit of the produce growers. Also, while exchange remains steady, prices adjust themselves, tend to confidence, and lead to increased exports. It would further appear that, in the present condition of India, looking to the fair adjustment of all interests concerned, a ratio of 1*s*. 8*d*., or 12 rupees to the sovereign, is what would most tend to develop trade, and be most equitable as between the seven great interests involved, viz.:—

(1) The Government and the taxpayers.

(2) The public creditor—*i.e.*, the holders of the rupee debt. Of the present 105 crores of rupee debt, 89 crores were issued when exchange was about 2*s*.

(3) The wage-earners, (including all salaried men, from the Viceroy to the coolie), and their employers. Wages, if exchange were about 1*s*. 8*d*., would correspond more nearly to the price of food than they do at present, and would be more in accordance with the rate of exchange at which they were generally fixed.

(4) Debtors and creditors.

(5) The holders of the coined rupees in circulation, who lose the whole of any depreciation.

(6) The producers in India, } both of whom lose, by
(7) The producers outside India, for the wants of India, } a fall in exchange, until prices adjust themselves thereto.

Bankers and merchants (so far as they are mere middlemen), are affected by variations in exchange only on their current outstanding transactions, on some favourably, on others unfavourably, and they can very readily adjust their subsequent working to any altered ratio.

4. It should also be noticed how steady the 5-years' average balance of exports over imports has been since 1867—about 20 millions sterling; but that the years that show best in this respect (leaving out 1862-7, already referred to as exceptional) were 1881–2 to 1883–4, when exchange was 1*s*. 8*d*. and 1*s*. $7\frac{3}{4}d$. This circumstance would also seem to point to a 1*s*. 8*d*. ratio as the most desirable on a just and equitable consideration of all the interests concerned. It should also be noticed that 1*s*. 8*d*. is about the average exchange of the 41 years ending 31st March, 1898—*i.e*, since India was transferred from the East India Company to the Crown.

December 1898.

No. 39.

MEMORANDUM by Mr. F. C. HARRISON, supplementing his EVIDENCE on the VOLUME of the RUPEE CIRCULATION.

1. Answers Nos. 2436 and 2455.

The recent census shows that rupees have probably come out from hoards in consequence of the famine. So far as we can judge from the census, the quantity does not appear to be considerable. I do not think the circulation of 1898 is greater than that of 1897.

2. TABLE on page 89 of Part I. of the Evidence.

The following columns can now be added to the table.

	1898.		1898.
W. IV.	·48	1883	1·08
1840 1st issue	4·08	1884	2·16
„ 2nd „	12·61	1885	3·99
1862–73	21·09	1886	2·32
1874	1·02	1887	4·31
1875	1·24	1888	3·47
1876	1·5	1889	3·89
1877	4·49	1890	6·61
1878	3·01	1891	3·60
1879	2·64	1892	5·75

1881	·37	Miscellaneous	·06
1882	2·89		100·00

3. Question 2424.

I have now had access to figures of a later date and find that they bear out my estimates, even better than I thought. I subjoin a short table:—

TABLE showing the result of the rupee census from 1892 to 1898 in percentages of the circulation:—

Year of Coinage in Groups.	Year of Examination.						
	1892.	1893.	1894.	1895.	1896.	1897.	1898.
William IV. 1835–40.	1·69	1·44	1·47	1·54	1·2	·7	·55
1840–76	42·74	39·06	38·19	38·90	39·7	39·92	41·51
1877–88	38·75	34·80	33·99	33·54	33·46	33·73	33·40
1888–93	16·74	24·66	26·73	26·01	25·64	25·65	24·65
Total	100	100	100	100	100	100	100

It will be noticed that in 1895, the William IV. rupee formed 1·54 per cent. of the circulation, and this percentage fell to ·55 in 1898, that is to say, it formed 1 per cent. less of the circulation than in 1895. But we know that we have recalled about 120 lakhs* of this issue. If, therefore, 1 per cent. equals 120 lakhs, we know the whole circulation must be one hundred times greater, viz., 120 crores; and this is the figure at which I have arrived by a totally different process of estimating. Strictly speaking, the validity of this reasoning depends on the assumption that the 1·54 per cent. and ·55 per cent. are percentages of a stable circulation. In point of fact, I believe the circulation of 1898 was about 120 crores, and that of 1895 about 124 crores. The difference is unimportant in this connexion, for my point *here* is not that the circulation has slightly increased or slightly decreased, but that it ranges about the figure of 120 crores.

I should mention here, that the entries for the William IV. rupee in this table are not in exact accord with the entries in the table on page 89. I did not consider it worth while to introduce into the latter the alterations made in the former.

* The exact figure down to March, including a few half rupees, was 119¾ lakhs, to which a little should be added for the receipts in April and May, after which the census took place.

4. Answer 2488.

The estimate given here was a guess made under pressure. Figures now before me show that the rupees recalled up to the end of October were about 138 lakhs, *i.e.*, 12 lakhs less than my estimate.

No. 40.

THE COTTON INDUSTRY IN INDIA AND THE FAR EAST.

REPORT of SPEECH delivered at the ANNUAL MEETING of the BOMBAY MILL-OWNERS' ASSOCIATION on March 22, 1899, by Sir GEORGE COTTON, Kt., Chairman.

(*Reprinted from the* "Homeward Mail," 15th *April* 1899.)

The cotton industry now is passing through a critical time. There has been a steady decline in the value of raw material during the past two years, owing to the large American crop last year and the anticipated larger one this year, and it has resulted in a correspondingly continued fall in prices of yarn and in such heavy losses to holders, both in India and China, as to have caused the absence of that speculative demand which so frequently acted as a buffer between the producer and the consumer by the holding of stocks which the spinner could not afford to finance, and the consumer declined to buy in a falling market until actual requirement compelled him. In addition to this, Japan, which had increased her spindles by some 50 per cent. during the past two years, owing to financial pressure, had to force her surplus production on the China market at less than cost price, and the Shanghai Mills, which were started under the impression that the closing of Indian mints gave them a special advantage over Bombay, had fared no better than their neighbours, and were selling yarn in their own markets for less money than it cost them to spin it. We in Bombay not only had to face bad markets, but to fight against plague for the past three years, which, by nearly closing our mills for want of hands during two or three months each season, and generally disorganising our labour, increased the cost of production at a time when, under normal circumstances, every effort would have been directed to economise. Owing to reduced estimates of the American cotton crop, and the consequent advance in price of raw material, the yarn market is now much firmer, and there in no longer a desire on the part of holders to get rid of yarn at prices below that at which it can be produced. This in itself should help the market, and the re-opening of the northern ports of China about this time should, I trust, also tend to improve the position.

Unsold and uncleared stocks of Indian yarn in China are still heavy, being 130,000 bales against 97,000 bales at the same time last year. But, in comparing these, it must be borne in mind that in addition to our own large exports, 450,000 bales for the year, China has absorbed large quantities of Japan and locally manufactured yarn, showing, I think, there is considerable room for expansion in her power to consume—expansion that must develop with the great opening-up now going on. We can only hope that for some time, at least, there will be no great increase in the number of Eastern mills, and that consumption will quickly overtake our increased production, enabling us again to secure a margin on the right side. But I think the time for handsome profits gone, and that in the future, we will have to content ourselves with more moderate returns on capital invested. The important question for us in India is, "Can we successfully compete with "Japan and China?" I think we can, because we have raw matertal on the spot and abundance of experienced cheap labour. Japan and China draw almost entirely upon India for their supply of cotton, and judicious purchasing in the purchasing of raw material is an important factor in the working of a cotton mill. A Bombay millowner, with a large market at hand where he can select his requirements, ought to have considerable advantage over his friends in the

Farther East, who must buy on sample or type, at times when freight can be obtained, and pay additional charge in the shape of buying commission. Japanese and Chinese mills may appear to have the advantage by working 22 hours per day, but experience has over and over again shown that the loss from heavy depreciation of machinery and inefficiency of labour, resulting from night work, more than counterbalance any gain from increased output.

I thought that the closing of the Indian mints would give Japan and China a great advantage in the matter of exchange, but experience shows that the prices for yarn in China move almost automatically with the rise or fall in the sterling value of the dollar, in the same manner that the decline or rise in the sterling value of the rupee is followed by a rise or fall in the value of our produce. As a matter of fact, exchange between India and China has, in sympathy with the steadiness of the rupee and of silver, varied less during the past few months than for some years past. I cannot see that cheap silver gives China any real advantage. The lower the price of the metal, the more she must give of it, or its equivalent, for anything she requires. This is, I think, strikingly illustrated by the fact that whereas, when silver was of more sterling value, the dollar would purchase 1,200 cash, cash being the copper currency used for small payments to coolies and others; now the dollar can only buy 800 cash. Now that the idea that the curtailment of currency is necessary to maintain exchange has been disproved, I would prefer leaving matters as they are, and giving a longer trial to our present currency law, which has not worked badly, considering that, in the face of plague, famine, and war, we have come out fairly well. I am of opinion that with increased railway facilities, which would enable produce to find its way to new markets, the balance of trade in favour of India must steadily increase; and that, except in famine years, we should not only be able to pay for our imports and meet our obligations, but would have such a balance to our credit that exchange could be maintained without further legislation. The present system has, to my mind, this advantage, that, if through famine in India or overstocked markets abroad, exports should fall off, exchange would decline, and in so doing would tend to stimulate our export trade for the time being. I trust the time is near when the financial position of the country will enable the Government to make Bombay a free port once once. The vexation, annoyance and hindrance to trade caused by import duties, even with the best regulated Customs House, can only be realised by those engaged in the import trade. We millowners do not complain of countervailing excise duty as in any way injuring us. In regard to competition between England and India, there cannot, as this Association has always maintained, be any competition between the fine goods of Lancashire and coarse cloth made in this country; but there can be no doubt that the Excise duties protect hand-loom weavers, and, as a consequence, we find that, whereas handlooms are increasing their consumption of yarn year by year, there has been no increase in machine-looms in Bombay since 1896, when the number was 21,335 against 21,379 at the present. I think we have good ground to make a representation to Government regarding this, the more so as it seems the time has come when, without any financial inconvenience, Government is able to repeal duties never intended to be permanent, or protect one class of industry against another.

Papers relating to CEYLON.

No. 41.

LETTER from the COLONIAL OFFICE to the CEYLON ASSOCIATION.

SIR, Downing Street, 7th May, 1898.

WITH reference to the letter from this Department of the 18th ultimo and to your letter of the 4th instant, I am directed by Mr. Secretary Chamberlain to inform you that the wishes of the Planters' Association of Ceylon and of the Ceylon Association in London, with regard to the appointment of Mr. T. N. Christie as a member of the Indian Currency Committee, were duly communicated to the Secretary of State for India, but Lord George Hamilton was only able to offer one vacancy to be filled by a representative of all the Eastern Colonies.

2. It seemed desirable that the dollar using colonies should be represented as well as Ceylon, and that therefore a representative should be appointed who was connected not only with Ceylon, but also with the Far East.

3. For this reason Mr. Chamberlain suggested the name of Sir A. Dent, K.C.M.G., as a suitable representative to Lord G. Hamilton, who has been good enough to appoint him.

4. I am to suggest that if your committee desires to offer any evidence specially affecting Ceylon to the Currency Committee, they should put themselves in communication with Sir A. Dent and with Mr. R. Chalmers of the Treasury, who is secretary to the Committee.

5. The memorial from the Planters' Association of Ceylon dated 12th ultimo, received from the Governor of Ceylon on the 2nd instant, will be communicated to the Committee.

I am, Sir,
Your obedient Servant,
The Secretary to (Signed) C. P. LUCAS.
the Ceylon Association.

No. 42.

Letter from the Colonial Office forwarding MEMORIAL from the PLANTERS' ASSOCIATION OF CEYLON.

Downing Street,
SIR, 7 May 1898.

I AM directed by Mr. Secretary Chamberlain to transmit to you, to be laid before the Indian Currency Committee, copy of a memorial from the Planters' Association of Ceylon, with regard to the effect of the currency policy of the Indian Government in Ceylon.

Mr. Chamberlain trusts that the Committee will be able to obtain full evidence on behalf of the Ceylon planting interest, and I am to enclose copy of a letter which has been addressed to the Ceylon Association in London on the subject.

I am,
Sir,
Your obedient Servant,
R. Chalmers, Esq. C. P. LUCAS.

Enclosure to above Letter.

To the Right Honourable
Joseph Chamberlain, M.P.,
Her Majesty's Secretary of State for the Colonies,
Downing Street, London.

The humble Memorial of the Planters' Association of Ceylon, and others having a stake in the continued agricultural prosperity of the Colony, and having for their object the good of Ceylon.

RESPECTFULLY SHEWETH—

1. That your memorialists, who are deeply interested in the cultivation of the staple product of Ceylon (tea) as well as in the general agriculture of the island, recognising the extreme gravity of the existing conditions of exchange and currency, desire to represent to Her Majesty's Government how disastrous the artificial high rate has been, how critical the position of the producers—European and native—is, and to urge the necessity for early action in such vital matters.

2. That your memorialists view with very great alarm the delay that is taking place in the settlement of the question of the Indian currency, which is the same as Ceylon, and consider it their duty humbly to point out to Her Majesty's Government that the continued prosperity of Ceylon is at stake.

3. That your memorialists of the Planters' Association of Ceylon passed the following resolution in August

1893, at a general meeting, and forwarded it to Government:—

"That the Government be urgently requested to take immediate steps to appoint a Commission to consider and report upon (1) the probable effect in Ceylon of the recent action of the Indian Government in putting an artificial value on the rupee; (2) the measures which it may be expedient to take to protect the interests of the Colony under the altered nature of the currency, as in the opinion of the Association the prosperity of the Colony has been seriously endangered."

4. That the Ceylon Silver Currency Commission appointed in response to the representation then made, reported in February 1894, and that many of the conclusions arrived at by the Commission have been verified, and few, if any, have been disproved.

5. That your memorialists are in full agreement with the conclusions expressed in paragraphs 14 to 20 and 24 to 28 of the Ceylon Silver Currency Commision Report hereto appended (Sessional Papers VI., 1894). Your memorialists would point to the diminished dividends declared by local tea companies, and in many cases to the absence of dividends in 1897, notwithstanding increased crops, and to the reduced value of tea property as evidenced by the Companies Share List quotations. In support of this statement, appended hereto is an editorial article in the "Times of Ceylon" of March 3rd (Appendix C.) and also an extract from the "Times of Ceylon" of March 19th 1898 (Appendix B). That this loss of profit in the tea industry—caused in a large degree by high exchange—has very seriously checked further extensions of tea cultivation admits of no doubt.

6. That your memorialists feel in addressing you that it is unnecessary to do more than emphasise the fact that competition with silver-using countries, where the currency is a bullion value currency, will soon be impossible by virtue of the enormous difference between the bullion value and the artificial value of the rupee—amounting at the moment to over 60 per cent. on the bullion value of the rupee. It is difficult, your memorialists conceive, to credit that the Indian Government is not well aware of this effect of their present policy, and that a positive bounty has been given thereby to the teas of China and Japan at the expense of the British-grown teas of Ceylon and India. In the words of the Report of the Ceylon Silver Currency Commission referred to above:—

"It is impossible to forecast or give any trustworthy opinion on the extent of injury likely to be done to Ceylon tea and other products competing with similar products grown in silver currency countries, as the extent of the injury hinges on the extent of the divergence in rupee value before referred to; but there is no doubt that if the divergence were large these Ceylon products would only retain their markets by accepting prices so low as to seriously imperil the prosperity of the largest producing classes in the island."

This statement is borne out by what is now occurring in Russia and the Continent, where at considerable expense, voluntarily submitted to by the producers in Ceylon (Ordinance No. 4 of 1894, for increasing the consumption of Ceylon tea in foreign lands), a trade has been opened and prospects were promising, but owing to the competition of China, favoured by her bullion value currency, the prices of Ceylon tea were forced down, and Ceylon producers are forced to accept a serious decline in prices, which tends to further lower rates now quoted in London.

7. That your memorialists agree with those who think that cheap silver, previous to the closing of the mints in India, was a potent, if not the most important, factor in developing the agricultural resources—which are the backbone of prosperity—of Ceylon, as of India, whilst they admit that stable exchange is a factor, though a minor one, tending to attract capital. Your memorialists affirm that capital seeks profit, not stability of exchange alone, and that where there are no profits capital will soon cease to flow. Further, your memorialists say that a high rate of exchange induces the withdrawal of capital from Ceylon to London and elsewhere. Your memorialists maintain that capital will inevitably flow where there is most profit and prosperity, but apart from this fact, your memorialists apprehend that stability of exchange is one of those objects of the policy of the Indian Government which it has not yet succeeded in attaining.

8. That your memorialists are of opinion that the present unsatisfactory condition of the currency question is intolerable, and that adequate consideration should at once be given to the subject by Her Majesty's Government, with a view to ascertaining the best measures to be taken to ameliorate the existing critical state of the producing industries, and to relieve the financial pressure. Already the local banks of Ceylon—unquestionably owing to the contraction of the currency through the closing of the mints—are charging from 12 to 15 per cent. interest on advances, rates which heretofore have only been levied by native money lenders on doubtful security.

9. That your memorialists rest assured that when confidence is established, capital will again flow freely to Ceylon and to India, and, without presuming to tender advice or to offer any opinion here as to the best remedy for the present unfortunate position of Ceylon and India, your memorialists would respectfully, but strongly, maintain that the producers' interests have been most severely injured by the experimental tampering with the currency in the supposed interests of the Indian Government.

10. Your memorialists would quote in this connection the following words from paragraph 24 of the Ceylon Silver Currency Commission Report: "The evidence "we have is conclusive that that fall (the fall of the "rupee) has not prevented the introduction of all "necessary English capital, and it is stated that there "is more capital offering for investment on reasonable "terms than has ever been the case before. There is "no practical or legal difficulty in securing the "repayment of sterling loans in sterling value, and "the loans of English capital, almost entirely made to "Europeans, are so secured."

11. That your memorialists believe that, having regard to the issues on which agricultural prosperity depends, it is to the best interests of Government that whatever steps are taken should be final, and that the problem can only be satisfactorily solved as a result of a fresh, impartial, and exhaustive inquiry, at which the producers will not be sacrificed, but will be fully represented, carried on on similar lines to that made before the closing of the mints in 1893, on the clear understanding also that the question of the gradual re-opening of the mints to the coinage of silver under certain conditions is included in the scope of the Commission.

12. That your memorialists rejoice to recognise that you consider it a duty incumbent on the British Government to draw closer to her colonies, to seek in her own family the strength and support which Great Britain can never find from foreign nations, and that the policy of Government is to bind the colonies closer by all means in their power, that the old policy of apathy and indifference is to be given up for one of initiative and resolution; that accordingly the prosperity of the Ceylon tea industry must necessarily be a matter of concern.

Wherefore your memorialists humbly pray that the gravity of the present crisis with regard to the producers of British-grown tea, as well as agricultural interests generally, may be earnestly considered by Her Majesty's Government without further delay, and that effective action may be taken for the amelioration and relief of many of Her Majesty's loyal subjects who are engaged in laudable and useful enterprise in the first Crown colony of the empire.

And your memorialists, as in duty bound, will ever pray.

On behalf of the memorialists,
F. G. A. Lane,
Chairman, Planters' Association of Ceylon.

Kandy, Ceylon,
12th April 1898.

APPENDIX A.

Extracts from Ceylon Silver Currency Commission Report referred to. (Sessional Paper VI. 1894.)

14. We think it advisable to mention retrospectively what has occurred in Ceylon during the last twenty years, while the gold price of silver has been falling.

Taking, first, the production of goods for export, Table W. in Appendix E. shows that the export of coffee, which in 1877 was worth almost 50 millions of rupees, has gradually fallen ever since, and that in

1892 it was worth only 3¼ millions: the fall was due to leaf disease entirely. Meanwhile the export of tea has gradually risen from Rs. 2,000 in 1876 to 32½ millions in 1892 and Rs. 40,723,329 in 1893. The value of the exports of other commodities generally has increased from nearly 11 millions of rupees in 1877 to 25¼ millions in 1892.

15. Preparatory to forming an opinion on the probable effects in Ceylon of the action of the Indian Government in enhancing the sterling value of the rupee, it was necessary that we should first enquire into and form an opinion of the proposition that Ceylon generally has benefited by the fall in the value of the rupee, which has been so pronounced during late years, and it may be convenient, in considering this all-important issue, to consider *seriatim* the classes named by Lord Ripon in his letter of 25th November 1892, to the India Office.

These classes were—

(1.) English merchants and traders.
(2.) Producers and inhabitants generally.
(3.) The Government.
(4.) English civil servants.

In considering the effects which the fall of the rupee has had on some of these classes, it is necessary to distinguish (1) between the effects of the actual process of falling, which would probably not affect more than one generation; and (2) the effects of a permanently low rupee, which would have a far more extended influence.

16. It is the first of these causes which really forms the chief hardship to the merchant and trader; it unsettled the local prices of European goods, introduced an element of uncertainty into many transactions, and affected all European capital brought into the island when the rupee was high, which would now, *cæteris paribus*, be much reduced in sterling value. The witnesses examined by us have made little complaint in this connection, and generally testify to their own prosperity and attribute it to that of the producing classes. The truth apparently is that all the European firms are so connected with, or dependent on, the planting industry that what is advantageous for their constituents is advantageous for them. The native traders have all their capital in rupees, and a large proportion of their business is with India, and they have consequently suffered even less than the European firms. The European business which seems to have suffered most and very seriously from the low value of the rupee has been that which encounters Indian competition. Local and Indian production has been stimulated and the European manufacturer has found it well nigh impossible to compete with goods manufactured in silver-using countries. It cannot, however, be said that the substitution of Ceylon and Indian goods for those of Europe is a matter for legitimate regret in these countries.

To sum up, the local merchant has a great volume of business owing to the progressive increase of exports and to the increase of shipping calling at Colombo. On the other hand he suffers from the harassing influence of a constantly fluctuating exchange, and the drawback of the shrinkage of capital engaged in business when measured in gold.

17. As exports have increased in value so have imports generally, and the whole body of importers has paid more silver for imported goods. The evidence taken before us shows that the local price of certain imported goods has fallen during the last twenty years in degrees varying with each commodity; but the same evidence also shows conclusively that the quality of some goods imported during the same period has deteriorated considerably.

We invite especial attention to this fact, as it does not appear to have been put prominently before other bodies which have previously discussed this subject.

Tradespeople attribute to the local consumer a determination not to pay more than a certain silver price for a given article, and they admit having lowered the quality so as to allow of their charging about the same price notwithstanding the lower value of silver.

18. In considering the second class named by Lord Ripon—producers and inhabitants generally—we have divided this class thus:—

A.—Producers (largely Europeans) whose production is carried on by wage-earning labourers.
B.—Indigenous native inhabitants, largely composed of small producers who cultivate their own ground.
C.—Immigrant inhabitants, chiefly employed by European producers.

19. The Class A is the one which would manifestly seem to have directly benefited by the fall in exchange, and the great majority of our witnesses was confident that this class owed much of its present prosperity to that cause; the few witnesses who held the opposite view based their opinion upon the belief that it was the low price of silver that has caused the sterling price of so many commodities to fall, but none of these witnesses could give good reason for their belief.

At the present moment it may be calculated that tea has become since 1888 worth to the producer almost as much as coffee used to be worth in the days of its greatest prosperity, while the value of other commodities exported has more than doubled. These figures indicate generally a considerable degree of prosperity in all classes of producers for export. The class which produces commodities for export other than tea—a class which includes almost all the native producers, except grain growers in the island—appears to have augmented its business in a very notable degree; the value of its exports has more than doubled (measured in rupees) in the last fifteen years—measured in gold the increment is 60 per cent. This denotes a general progressive increase of prosperity amongst the producing classes and those depending on them.

We are of opinion that the low price of silver has stimulated the production of many commodities, and that the increased production so caused has naturally tended to lower prices; but on the question of a direct connection between the price of silver and that of other commodities our views are identical with those expressed by Lord Herschell's Committee, which, substituting "Ceylon" for "India," runs thus (paragraph 22): "It has indeed been alleged that the fall in the "gold price of certain (Ceylon) products is to be "attributed to the fall in the value of the rupee, but "this allegation is strongly controverted; and having "regard for the phenomena presented in the case of "(Ceylon) products not greatly open to competition, "and to the necessary effect of competition in the case "of those which are within the sphere of its influence, "it seems far from clear that the fall in the gold price of "(Ceylon) products would have been materially less if "the exchange had not fallen."

But whether there be an intimate cause-and-effect connection between the price of silver and the price of commodities or not, one thing is clear, viz., that the lowering of the gold price of commodities has equally affected those grown in a gold-standard country and those grown in a silver-standard country. Tea grown in Java—a gold-standard country—has shared to the full the diminished gold value of that product, and it has not shared in the compensating diminished cost of production, due to low exchange, which has enabled the Ceylon industry to retain its prosperity. The rate of wages paid to unskilled Tamil labour on the estates has not increased during the past eighteen years. It fell somewhat in 1886, and in some portions of the planting districts there has of late years been a rise to the old level. The rate of wages to Singhalese labourers has always been considerably under that paid to Tamil immigrants, and our evidence points to a general tendency towards an increase, although there is a large exception in the cinnamon estate labourers, whose wages have diminshed. The real capital value of estates must depend upon their profit-yielding capacity, and if that capacity has been maintained owing to the effects of low exchange, the owner, even although he might not be able to get the same sterling price originally paid on purchasing the estate when the rupee was high, is indebted to the low exchange for having counterbalanced the fall in the sterling value of his produce, which would otherwise render his property profitless and possibly valueless. We are of opinion that Class A—the European and native owners of estates, whose expenditure is largely on unskilled labour—has benefited by the low exchange which has ruled in late years.

20. Class B is chiefly made up of the Sinhalese population and the Tamils settled in the northern and eastern portions of the island, many of whom are large producers of exported products—the value of the exports which can be classed as coming from native producers being over twenty millions of rupees per annum—and these stand in connection with exchange in much the same category as Class A. Another large section of Class B is directly or indirectly dependent on the spending power of the estate owners and labourers in finding a market for what this section has to sell.

The imports from foreign countries used by this class are small, and as regards clothes the evidence we have collected shows that they are at present both cheaper and inferior to the clothes of twenty years ago. As regards rice, it has for the last three years been dearer than twenty years ago; those in the interior who eat kurakkan are said to find the product dearer; but as the labourers are nearly always paid by a share of the produce, its increased money value may not be against the general interest of the labourer.

The circumstances of the ordinary wage-earning labouring inhabitant of Ceylon, who may have little or no property, and therefore cannot be classed as a producer, have varied very much in different parts of the island; and it would be impossible to lay down any rule applicable to all.

We append a mass of statistics (Appendix D) on the condition of the peasant labourer in all parts of the island. We have felt compelled to use great caution in making use of this information because, in the absence of historical data, the tendency of men's minds is generally in similar circumstances to describe the past as a time of easier conditions of life.

The poorer labourers, male and female, about Colombo have suffered greatly from the collapse of the coffee enterprise, which used to find them easy employment, and the development of the city as a port of call has not yet compensated them.

The class of labourers for hire has increased generally, and the demand for labour has also increased; it has been proved that the rate of wages has been raised in the Jaffna, Trincomalie, Metara, and Hambantotta districts, and in the Western province during the last twenty years.

On the other hand, the rate for peasant labour in the Central, Western, and Sabaragamuwa provinces appears to have remained fairly constant—at about three days' labour for a rupee; but that rate had only recently been attained in 1870. The rate in 1864 was generally a little lower.

24. When, leaving the individual classes and interests mentioned in foregoing paragraphs, we review the general position of Ceylon and its trade, we find that during recent years the statistics which are usually held to be indices of a country's progress point to a general increase or prosperity during the period when the fall of the rupee was most marked.

The evidence we have is conclusive that that fall has not prevented the introduction of all necessary English capital, and it is stated that there is more capital offering for investment on reasonable terms than has ever been the case before. There is no practical or legal difficulty in securing the repayment of sterling loans in sterling value, and the loans of English capital, almost entirely made to Europeans, are so secured (*see* Appendix D. 13). Native borrowers and lenders deal entirely in rupees, and have been in this respect unaffected by the fluctuations of exchange.

25. Our opinion is that up to the present time a bullion silver currency, coupled with a falling rate of exchange, has been for the benefit of the greatest number; in other words, the sum of the advantages has preponderated over the sum of the disadvantages, and, as far as we can see, the action of the Government of India is not advantageous to the general interests of Ceylon, provided—

A.—That the readjustment of all local salaries, wages, and prices to the altered value of the rupee could be deferred for an indefinitely long time;

B.—That the future rise in the general revenue would be sufficient to keep pace with the increase in the obligations of Government, consequent on the altered value of silver; such rise being secured either by the revenue naturally rising *pari passu* with the increased demands on it, or by additional contributions from the producing interests specially favoured by a bullion silver currency and low exchange.

26. With reference to the possible readjustment of local wages and prices measured in silver, while we find that there is in Ceylon a slight tendency towards increasing wages, and a more general tendency towards increasing prices (after taking duly into account local exceptions and certain prices which have decreased), such increase bears no actual proportion to the progressive decline in the gold price of silver, and it can hardly be attributed thereto.

It is our opinion that the date of such a general adjustment of wages and prices is uncertain; that it will probably be remote, and that it may be postponed for an indefinite period of time.

We may note that this conclusion agrees in the main with that arrived at by the three Chinese members of the Straits Currency Committee of 1893, and with those of Mr. Carden in his Report on Mexico, No. 302 of 1893 (F.O. Miscellaneous Series, C. 6856—50), and with those of Mr. H. H. Gibbs as a producer in a silver standard country (C-5099, Minutes of Evidence, pp. 149–159, and Appendix X. 2. signed J. M. Lowe).

27. The rise in sterling prices of commodities, which a few of our witnesses look for as a result of the action of the Indian Government, and which would compensate the producer for the rise in exchange, would, if it came at all for such a cause, follow at a distance while the adverse effect would be immediately in operation. We do not, however, think that a gradual and moderate rise in the sterling value of the rupee would, if equally felt by the currencies of other silver-using countries, seriously affect the prosperity of the colony, but the effect of the recent action of the Indian Government which we are now considering has, so far, not been to raise the value of the rupee (except for a short period of speculation) above its pre-existing value, but to create a great divergence between the token currency value and the bullion value of the coin, and it is this divergence in value which menaces the prosperity of some of the island's staple products.

The Extent of this Divergence is shown by the following Figures.

——	Divergence.	Bullion Value of the Rupee calculated at the Market Price of Silver, plus 2 per cent. Seignorage.	Exchange Value of the Rupee.

28. Tea, the staple product in which Europeans are interested, and the cocoanut palm products forming the chief native exporting industry, are the two enterprises most seriously affected, both being in competition with countries further east, where the currency is silver of bullion value.

It may safely be concluded that in such a vast and conservative country as China it would take many years before any change in the external purchasing power of the dollar would affect its power of purchasing local labour or articles produced for consumption in China, and that being so, it is evident that with tea at a given sterling price the European importer could afford to give the Chinese producer a higher value in local undepreciated currency than he could to the Ceylon or Indian producer in their local currency.

We have received through the Government a report from the British Legation at Tokio (Appendix D. 44), which indicates that since 1st May last there has been a considerable increase in the export of tea from Japan; and figures recently published in the *Ceylon Observer* respecting the export from China, while they indicate an increase since 1st May last of 6½ million pounds to Russia, and 1¼ million pounds to North America, show a slight falling-off in the export to Great Britain. But it is evident that the progressive decrease (*see* Appendix E., Table T) in the export of tea from China which has taken place every year since 1886, to the benefit of India and Ceylon, has now ceased, and is likely to be replaced by an increase which would be a serious disadvantage to this country. We have since received interesting reports (Appendix D. 46, 47, 48, and 49) from Pekin, Shanghai, Hankow, and Foochow.

Ceylon tea is produced solely for export, and it is not improbable that its production would be continued for

a considerable time in spite of almost any fall in price, and the effect of this exchange premium in China's favour would therefore be manifested less by any remarkable increase in the export of China tea or displacement of Ceylon tea than by prolonged reduction in the price of tea to a figure which was so low as to prevent Chinese growers, even with a premium of, say, 1½*d.* or 2*d.* per pound in their favour, exporting with profit.

It is impossible to forecast or give any trustworthy opinion on the extent of injury likely to be done to Ceylon tea and other products competing with similar products grown in silver-currency countries, as the extent of the injury hinges on the extent of the divergence in rupee value before referred to; but there is no doubt that if the divergence were large these Ceylon products would only retain their markets by accepting prices so low as to seriously imperil the prosperity of the largest producing classes in the island.

APPENDIX B.

(*Times of Ceylon*, 19th March 1898.)

Below we give the averages for the past three years of a number of well-known and representative estates in various parts of the planting districts, and this table will afford facilities for further comparisons:—

APPENDIX C.

CEYLON COMPANIES AND THE LOCAL SHARE MARKET.

(*Times of Ceylon*, 3rd March 1898.)

A detailed study of the state of the local share market, and of the prospects of both sterling and rupee capital tea and other produce companies—more particularly those formed during the past two years—shows how severe has been the relapse after the inflation of 1895. It is a very disappointing statement which we have to make; but not to face the situation would in no wise improve it, and it is better to regard things exactly as they are. The record of losses during 1897 on local quotations—accentuated this year to the present date—when reckoned on all the existing scrip, assumes astounding proportions; and use must be made of it to show the home authorities how adverse conditions have combined to check our prosperity—the prosperity at present, principally, of the European community in Ceylon. Its reflex action upon the island generally has not become very manifest yet; but must already be bringing its influence to bear in many directions. What the natives felt during last year more especially was the dearness of rice due to the Indian famine, and enhanced up-country by the Allagalla rock-slip. The immigrant estates coolies, in many cases, suffered less than others in this way, because the majority of estates shared the additional cost with their labourers. This has tended to further reduce the profits of not a few public companies; but it is fully realised now that the prime and lasting cause has been the artificial exchange, to which the prices of our staple have in no degree responded. It is not a characteristic of the Ceylon planter to bemoan bad luck. If it come to him in the ordinary risks of tropical life and work he is prepared to take his chance and accept the results in a manly way. Low prices do not force a complaint from him if he be competing on equal terms with the rest of the world; but when he realises that he has not a fair field, that his case, in spite of his highly-praised pluck in refusing to be wiped out by the coffee crisis, has not received consideration in connection with the present financial operation permitted in India, then his indignant protest is natural, and his protests will become louder and more urgent until they are regarded. We hope the Governor, as largely responsible for the continued prosperity of the country during his rule, has already addressed the Secretary of State on the situation. If this has not been already done, the figures which we give to-day will, we trust, supply his Excellency with some reliable material.

In a special view of the local share market in 1895, which we gave in January 1896, we remarked that two great features divide the past year with remarkable distinctness, the first half having been noteworthy on account of the large amount of business done in old shares and their appreciation in price; and the second half for the number of new companies incorporated. We showed that, almost entirely in the latter six months, eighteen rupee companies, having a paid-up capital of Rs. 5,848,500 and a nominal capital of Rs. 8,860,000, had been registered. In a similar retrospect, a year later, it was stated that the feature of 1896 was the number of sterling companies formed. The companies floated in London during that year numbered thirteen, with a paid-up capital amounting to 902,170*l.*, which showed that four and a half times as much had been invested in London as in Ceylon, where during the same twelve months the public tea companies founded numbered eleven, with a paid-up capital of Rs. 3,259,000, and a nominal capital of Rs. 5,940,000. 1897 has been notable for the entire absence, since the first month of the year, of the formation of any local companies except of a private nature. In the January of this year one company was registered, and its shares are now quoted in the official list; but, from January to January exclusive, the public were not appealed to in the matter of a single new rupee tea company. The floating of limited liability concerns in London continued during last year, however; and, while the first half of the year saw some huge companies formed having joint interests in this island and in Southern India, the latter half was marked by the floating of a company representing the largest number of Ceylon estates that have been brought together for one flotation. We are unable to prophesy what lies before these later companies. Nor can we deal, to-day, with the prospects before the planting community as a whole; but in the tables which we append we show how the older local institutions, whose capital figures per acre were small, have been able to stand the present strain much better than those brought out when the vendors were able to get more favourable prices for their properties. The first table we give is of local companies which have been formed long enough to show the fluctuation in prices since the years 1895 and 1896. The first three columns represent the quotations

on the 1st January of the respective years, and the last column is brought up to date, embodying the alterations made by the committee of the Sharebrokers' Association at their meeting on Tuesday last. Some of the quotations are ex-dividend, but very few are affected by the deductions made for such payments, though mention may be made of Agra-Ouvah, Clyde, Glasgow, Kirklees, Knavesmire, Maha Uva, Tonacombe, and Upper Maskeliya. On the other hand, we have almost as many described as "nominal," while practically all in the list are now marked "sellers," which means, in the present state of the market especially, that business could be done only at figures more or less lower than those quoted.

FLUCTUATIONS OF THE OLDER RUPEE COMPANIES.

	Jan. 1.			Mar. 1,
	1895.	1896.	1897.	1898.
Agra-Ouvah Estates	700	1,125	1,300	1,040

Weoya Tea	195	330	317½	‖
Yatiyantota	3,250	6,000	7,750	‖

The above particulars show the "slump" per share of the concerns named; but we now have to show what the fall means over the whole of the local produce companies, and on the total number of shares involved. The figures thus produced are what we referred to in our introductory remarks as almost incredible. We are, however, sure of the fact that we have not made out the total loss to be worse than it really is. We include the very latest addition to the shaerbrokers list, which slightly reduces the net depreciation, and we repeat that, by taking the present quotations, we do not unfairly expose the weakness of the market:—

* Nominal.
† In 1896 the par value of these shares was reduced from Rs. 100 to Rs. 60.
‡ Absorbed in other companies.
§ Rs. 100 called up on January 1, 1896 and 1897; Rs. 250 called up now.
‖ Since amalgamated into a sterling company, at 20*l.* shares, now quoted at 8*l.*

RUPEE COMPANIES.—TOTAL CHANGES IN FOURTEEN MONTHS.

Total	14,920,040	15,752,150	5,959,222
		Less Appreciation	158,700
		Net Depreciation	5,800,522

* Present quotations nominal.
† Changesin par values allowed for.
‡ Companes formed in 1897 or 1898.
Note.—Patiagama Plantations Co., capital issued Rs. 80,000, is omitted from this list, not being quoted.

From the foregoing it will be noticed that the present quotations are still higher, taken all round, than the par value of the shares, the totals respectively being Rs. 15,752,150 and Rs. 14,920,040. To show in what proportion the older companies conduce to this, we divide the list into those formed in 1894 or earlier and those registered in 1895 or later. Of the 25 constituting the former 16 are above par; one is unchanged; and eight are lower. Of the 26 quoted concerns forming the latter list, three are higher; three are unaltered; and 20 are lower, as follows:—

COMPANIES FORMED prior to 1895.

Year.	——	Par.	Present Value.

No. 43.

MEMORIAL from certain INHABITANTS of CEYLON.

The Right Hon. Joseph Chamberlain, M.P., Her Majesty's Secretary of State for the Colonies, Downing Street, London.

The Memorial of the undersigned Inhabitants of Ceylon,

Respectfully sheweth,

THAT they represent the general community of the island, embracing all classes, and that they humbly beg to set forth the disadvantages under which they are at present suffering, and the deplorable condition to which the producing and exporting interests of the colony are being reduced, owing to the policy of the Indian Government in regard to the currency and the resultant artificial rate of exchange and dearness of money.

2. That this colony is dependent on India in a very large measure for its labour and for its food supplies, these having to be paid for in rupees. The currency of Ceylon is identical with that of India, and cannot now apparently be dissociated from it.

3. That with interest and discount ruling as they are now, at about 15 per cent. on approved security in Colombo, and even higher at outlying districts, the severe strain is exercising such a very adverse influence, that no industry can for any lengthened period stand it, and that business of all kinds is restricted and is being gradually strangled.

4. That the staple export products of this colony are not grains or cereals which are cultivated annually, and which, if found to be unprofitable from any cause one year, need not be cultivated the next, but consist of articles the cultivation of which requires a large capital outlay, and which have taken years to bring into production. If, therefore, the cultivation of these products be rendered unprofitable, and over a large proportion of the cultivated area of the colony, this point is dangerously near, the land will have to be abandoned, and the result would be the loss of capital that has been invested and of all the time and energy that have been spent. In a word, it would mean ruin to many of those engaged in these industries, and

prove a serious loss to the Government and colony generally. There might then be a recurrence of the calamities which afflicted the colony after the failure of coffee.

5. That from its dependent condition the colony, merely by its adoption of the Indian currency, is obliged to be a party to the arrangements which were proposed and carried out for the supposed benefit of India, and is without any apparent means of extricating itself from its present difficulties.

6. That as the success of the efforts to establish the rupee at 1*s.* 4*d.* under the present policy depends upon the success attained in rendering it scarce, it is manifest that so long as this scarcity is maintained money will be dear, all business be carried on with difficulty and the prosperity of this island endangered.

7. That they do not believe that the Indian Government anticipated this effect of its policy, and they would urge a consideration of the position on your part in the interests of this island, more especially as, when the action was taken, the ill effects of which they are now suffering from, the interests of the producers in India, largely consisting of uneducated natives, unable to voice their own interests, were overlooked.

8. That the producing interests of Ceylon, your memorialists would point out, are overwhelmingly more important than any other, and these interests through the colony's exports, over two-thirds of which are sent to the United Kingdom, suffer in a disastrous way from an artificially inflated rupee, since so many of its products compete with those exported by other countries using a silver currency based on silver bullion value.

9. That whilst fully recognising the difficulties of the Indian Government, your memorialists are of opinion that any tampering with the currency must be injurious to the trade of this colony, upon the prosperity of which all revenue, public and private, is dependent, and they pray that such steps may be taken as may be effectual to afford them speedy relief.

Colombo, 25th March, 1898.

Ceylon Chamber Commerce identifies itself with Currency Memorial Inhabitants Ceylon 25th March. Chamber further strongly condemn currency proposals, Government India.

No. 45.

Letter from Mr. E. Harcourt Skrine, to the Right Honourable J. Chamberlain, M.P.

Sir,

As an owner of tea property in Ceylon, I have the honour to offer some remarks on the subject of the currency, which has, I understand, been dealt with in a memorial to the Colonial Office by the Ceylon Planters' Association. That memorial had not been published when I left Ceylon last month, and it was therefore not in my power to address any representation on it through the official channels, but, inasmuch as I deduce some very different conclusions from the premises upon which the case for the planter is there argued, I venture to hope that I may be allowed to submit this letter for your consideration.

In so far as the Planters' Memorial is descriptive of the mischievous results to the Ceylon tea grower from the enforced contraction of the currency, it must command the loyal support of all producers, but when it goes beyond this, to recommend as a remedy the re-coinage of silver on the basis, as I understand, of a somewhat lower exchange for the rupee, I think it is time to bring to light some of the fallacies that in my opinion have obscured the judgment of the drafters of that memorial.

To instance these fallacies, I must refer you to Clauses 20 and 26 of the Memorial.

The concluding paragraph of Clause 20 says: "The "rate for peasant labour in the Central, Western, and "Sabaragamua Provinces appears to have remained "fairly constant at about three days labour for a "rupee, but that rate had only recently been attained "in 1870. The rate in 1864 was generally a little "lower."

Clause 26 says: "With reference to the possible "readjustment of local wages and prices measured in "silver, while we find that there is in Ceylon a slight "tendency towards increasing wages and a more "general tendency towards increasing prices, such "increase bears no actual proportion to the progressive "decline in the gold price of silver, and it can hardly "be attributed thereto. It is our opinion that the "date of such a general adjustment of wages and "prices is uncertain; that it will probably be remote, "and that it may be postponed for an indefinite period "of time."

The object of both these clauses is to establish the contention that India and Ceylon as silver-using countries are incapable of re-measuring their commodities in gold. I admit that there is much apparent justification for this contention, opposed though it be to an inevitable natural law, but the fact that it is so opposed should have led the planting body to regard their inferences with suspicion.

The Planters' Association accepts the fact that the rate for peasant labour has remained constant at about three days' labour for a rupee from 1870 to 1898, as proof that the decline in the gold price of silver has not resulted in a proportionate rise of wages. It is the purpose of this letter to show that while the labour wage has, it is true, remained constant at three days' labour for a rupee, the value of that wage to the coolie has been enhanced fully 40 per cent. during that period —or the equivalent of the fall in silver—by compensating advantages.

To trace these it is necessary to give a brief review of the labour wage for the past 34 years.

The Memorial admits that (1) during a period of par of exchange 1864 to 1870, the coolie wage was rising to some slight extent. That rise was commensurate with a staple trade price for coffee, and may fairly be taken to indicate a normally appreciating labour wage.

(2.) A second period, 1872 to 1881, was a period of great inflation, coffee prices rising from 65*s.* per cwt. to 130*s.* This inflation was reflected in Ceylon by correspondingly higher cultivation. Labour that had in previous years been paid off after crop, to return to distant homes in India, was kept on for manuring and other works. Consequently the normal condition of a slowly rising wage was arrested, and made up to the cooly by this new found employment during the slack season. This period of high cultivation, the latter years of which balanced the first fall in silver, may be said to have ceased in 1881, when leaf disease and a collapse in the price of coffee brought the country to the verge of bankruptcy. It was succeeded by (3) a period of transition from the cultivation of coffee to that of tea. During this period, 1881 to 1885, the coolie wage was, it is true, still constant at three days' labour for a rupee, but the coolies were often not paid at all, and on some estates worked for years on a bare subsistence in rice. On estates worked with reserve capital a very rigorous task was exacted, such as is certainly quite unobtainable from the coolie of 1898, and a fuller value to the producer was undoubtedly obtained for the same wage. The argument of the apparent uniformity of the wage at the period preceding tea is, therefore, of little account. The coffee enterprise, while favoured by the exchange, may be compared to a ship with a favouring breeze, struggling vainly against a maelstrom. Indeed, so disastrous to labour was the ruin of coffee that, notwithstanding the collapse of silver which accompanied it, wages, that should have risen in accordance with a natural law, were actually lower estimated in the balance of earnings available to the coolie than they were when the exchange was at par. The natural result of all this was that the country was being rapidly denuded of coolies.

With these conflicting influences at work, it is idle to assume that the uniformity of wage had, up to 1885, anything necessarily to do with the question.

Period 4.—Subsequent to 1885, the uniformity of wage argument is still further discounted by the altered circumstances to the coolie in tea. Whereas, in coffee, a large proportion of the labour force was paid off to return to their homes at the end of crop, the women that remained worked half time, and the children not at all; the whole Tamil family finds in tea a

constant full wage all the year round, and the women and children—the least useful labourers in coffee—have become the labour most in request in tea. The wage continues the same, "three days' labour for a "runee" but the earnings of the Tamil family have increased fully 40 per cent., or very nearly, if not quite, the equivalent of the fall in the gold value of silver, which the Planters' Memorial contends has had no such result. These advantages to the coolie (equivalent to a direct rise in wages) have been further added to by improved journey facilities to India. The Southern Indian Railway to Tuticorin, made in 1875, gave the coolie direct communication with his Indian home, superseding a toilsome march of many hundred miles by the circuitous Northern Ceylon route *viâ* Mannar, a route which was quite impracticable for weakly women and children. I am satisfied that this view of the question has been entirely overlooked hitherto, and that, if it is fairly sifted, it will be found that the coolie has been more than compensated for the fall in the purchasing power of his wage by the increased volume of wage earnable, and by easy access to his country.

The contention of the Planters' Memorial—that prices have remained unaffected by the fall in silver—can be similarly tested in the history of the rice market. This article, less than any other produce, lends itself to remeasurement with the rise or fall of the precious metal used as currency, because it is cultivated on lands that can grow little else.

It will be found that previous to the great famine in 1876 rice was selling in Kandy at Rs. 3 per bushel, and in 1895 previous to the last famine at Rs. 3·50, or a rise of 16 per cent. The latter price, however, by no means represented the real rise in value paid to the Indian producer, for his cost of transport in 1896 had been enormously reduced by railways and cheaper freights. If allowance is made for this it will be found that the price received by the Indian rice grower in 1896 was some 30 to 40 per cent. higher than in 1875, so that here again the natural law of remeasurement of the commodity in the currency had been at work.

In those two main instances—the coolie wage and the price of rice—a nominal but deceptive sameness of rate in Ceylon is used as an argument to support the contention that these commodities have not remeasured themselves in silver, and therefore will not remeasure themselves in gold if the latter currency is resorted to. I arrive at the opposite conclusion, and am of opinion that if the depletion of the Indian original currency silver is rectified by an influx of gold to restore the equilibrium between currency and commodities the producer, equally with all other classes, will be benefited. Mr. Allan Arthur, in his standard letter, has shown the disadvantages certain to recur by a partial re-opening of the mints to silver, which is what the Ceylon Memorial advocates. The result to Ceylon tea of such a policy would be to foster the existing over-production which is likely, in any case, for some years to be a greater hindrance to profits than the recent high exchange.

On the other hand, the introduction of a gold standard will have the following beneficial effects. If the transfer is made at a fair rate—and I consider a fair rate to be that which was ruling before the American legislation which led to the closing of the Indian Mint in 1893, and which I will take, for this and other reasons, at 1*s.* 3*d.* per rupee—the results to the tea producer will be (*a*) he will have a fair amende made to him for the present unduly high rate than that recently forced upon him; (*b*) the stringency of the money market, as evidenced by prohibitory bank rates of interest will cease; (*c*) the English investor will acquire confidence and lend money on mortgage in Ceylon at 5 per cent. where he would not now (under the uncertainty of ever getting his capital back) lend it at 10 per cent.; (*d*) there will be a mitigation, if not an end, to the recurring periods of inflation and depression, which have been most injurious to sound enterprise, and must continue to occur with an untrustworthy currency medium. There will be less phenomenal profits but they will be constant; (*e*) the transition to gold will furnish the opportunity for reconsidering the coolie wage. If the Southern Indian rate of 4 as. for men and 2½ as. for women commands a full supply of labour there, the Ceylon rates of 6 as. for men and 5 as. for women, taken in connection with the new journey facilities, would appear too high. At any rate the subject would have to be reconsidered, if only to supersede the custom of making profits on rice, which has always been a considerable factor in Ceylon in the wage question. These profits are likely to be very considerable if rice comes to be remeasured in gold, and, being always open to misconception, it would be better to abandon them in favour of a reduced wage; (*f*) the steadiness given to the cost of production would induce the planter—instead of looking to the fall of exchange to help him—to develop his own latent economies. There is no doubt that labour is not nearly as efficient as it might be, estates having been flooded with new and untrained coolies supervised by young men from England, who are gaining their experience at the expense of the industry; (*g*) when these results have been worked out, it will be found that there is little to fear in the competition from silver-using countries on which so much stress is laid in the Planters' Memorial.

Our China competitors will be unsupported by cheap capital as in Ceylon, and rice—the food of the China coolie—must rise in price as the gold countries purchase it. The quality of China labour must also deteriorate in proportion as it is ill-paid and ill-fed.

I have ventured to suggest the transition from a silver to a gold currency at the rate of 1*s.* 3*d.* per rupee not only because it appears a just rate, but also because it will lend itself better than any other to the double necessities of England and India, seeing it would be represented by a gold coin the equivalent of 12*s.* 6*d.* in England and Rs. 10 in India. The present stock of rupees is not more than sufficient for token requirements, and it must be remembered that the burden of currency work in the East will always fall on the token coins; *e.g.*, in monthly payments for labour, the individual wage, after deducting food supplies, but seldom reaches Rs. 10. This fact disposes of the idea that the demand for gold for circulation in India will ever in any way compare with the like demand for it in England, where the labour wage is so much higher and food is not made part of the terms of payment.

This letter of course accepts the theory that the Indian Government was justified by the cyclonic disturbance to the currency created by American legislation in contracting the Indian currency to meet a special danger, but the object having been served, it is bound to revert to a sound principle which at the present stage can only mean a *bonâ fide* gold currency for India.

I have, &c.,
(Signed) E. Harcourt Skrine.

New University Club,
St. James' Street,
9th May 1898.

No. 46.

Letter from Mr. E. Harcourt Skrine to the Indian Currency Committee, supplementing No. 9.

Claverton Manor, Bath,
Dear Sirs, 23rd November, 1898.

As Mr. T. N. Christie has been examined at great length on the Currency question as it affects the Ceylon planter by your Commission, I venture to request that I may be allowed to supplement my own paper in support of a different view on the same subject by the following remarks.

Whereas the Ceylon Planters' Memorial in effect represents the views of the local agents of dividend-earning tea companies of recent growth, my connection with Ceylon dates from 1872, during all which time I have remained in possession of my estates as a *bonâ fide* cultivator and continued to develop them through all the vicissitudes of production. On the ground, therefore, of the producer I claim to speak with experience, if not with authority. The producer, however, represents but one of at least three conflicting interests affected by the currency question, and I can well understand that his evidence should be limited in just proportion.

My own views, however, are not those gained by a producer only, for I have had quite as much experience as an importer of Manchester goods. During the three years which marked the first great fall of silver—1876 to 1879—I was in charge of a business house in Southern India, and was fully sensible of the injurious effect of the depreciation of the rupee on import business. Whatever, therefore, my private feelings might be as a producer, of the advantages of cheap silver, its disadvantages to the importer were equally apparent. I venture to think that this dual experience is one not

generally shared in by the witnesses you have examined. Moreover, since my memorial was sent in much additional light has been thrown on the feasibility of a gold standard in India, and it is in connection with this question that I should like to supplement my paper. In it I advocated the transition from a silver currency to a gold one at 1*s.* 3*d.* per rupee, having for its basis a gold standard and currency coin, to be minted in India, the equivalent of 10*s.*

It has been remarked to me that others have advocated 1*s.* 2*d.*, and others again 1*s.*, why then should a 1*s.* 3*d.* basis be accepted more than either of these? On the same argument it might be added that the Government proposal of 1*s.* 4*d.* is equally fanciful, but I venture to submit that the claim to transfer at 1*s.* 3*d.* has alone, of all others, a logical basis, inasmuch as that was approximately the rate current when the mints were closed. From a purely logical, and therefore just, point of view, the transfer should then and there have been effected, and any forcing up of the value of the rupee subsequently is, on economical principles, indefensible. As it is my duty to confine my arguments to Ceylon I shall show that the 1*s.* 4*d.* rate is injurious to the interests of both labour and capital in that country.

My memorial has shown that under the circumstances of tea, the labour wage is abnormally high at present. The tea industry, which could afford to pay that wage with a 1*s.* 3*d.* rupee, cannot do so if a 1*s.* 4*d.* basis is insisted on. If this industry, on which the island revenue depends, is to be sustained, it must be by either lowering the rates of cooly pay or by giving effect to the logical and just exchange rate of 1*s.* 3*d.* The first solution would be a drastic but dangerous remedy which can only be imposed by the proprietary, or accepted by the labour, after much distress and incalculable loss to both, which will have its echo in England in raising the price of tea, the principal beverage of the masses. If such a result comes about its origin will be fully explained to them. On the other hand it is in the power of the Government to ease the situation by transferring at 1*s.* 3*d.*, and save Ceylon from a calamity which may only in degree be inferior to the state of things in Barbados, and which it will have itself imposed.

I have still two remarks to add to my memorial. The first is to anticipate the assumption that a gold currency in the East will be absorbed for hoarding. Lately in Ceylon I have had sovereigns offered me by a native banker in the interior at below their Colombo market value, and seeing that the enormous volume of gold which is absorbed annually in the East is obtained at cost price the demand for hoarding is fully met as it is. An Indian mint would come into competition with this demand and attract gold now hoarded, more especially in times of stringency.

The other remark, also from a Ceylon standpoint, is as to the necessity, if a gold standard is adopted, that it shall be reasonably effective for purposes of currency as well, and that it shall correspond with the note circulation. The sovereign does not meet these requirements. It corresponds with no note issue in India, and in Ceylon where the Colony has been made to think in decimals by the Government, it will have no currency utility whatever. It will serve only to illustrate the expression, "If thy son ask bread of thee wilt thou give him a stone?"

I am, Sir,
Yours truly,
(Signed) E. Harcourt Skrine.

The Members of the
Indian Currency Committee,
c/o Robert Chalmers, Esq.,
Secretary, the Treasury.

No. 47.

Letter on Ceylon Currency, by Mr. H. W. Gillman. (Received through the Colonial Office.)

Clonteadmore, Coachford,
Co. Cork, 9th July 1898.

Ceylon Currency.

Right Hon. Sir,

Some unknown friend has sent me a copy of the letter addressed to the Secretary of State for the Colonies (under date 19th May last) by the vice-president of the Ceylon Association in London on the above subject in connection with the present currency proposals of the Indian Government.

I take the liberty of inviting consideration to the fact that, of the evils which are indicated in this letter, one is beyond control, and as regards the other it is open to the Colony at its own option to adopt a remedy.

Two chief arguments are put forward in that letter as follows:—

1st argument—That the establishment of the rupee at 16*d.* has so curtailed profits of tea estates as to raise alarm as to the future of the industry and to check any further extension of the tea acreage.

But a consideration of the *net* gold prices of tea, with the cost of production per lb., and with the rise and fall of exchange of the rupee since 1893 (when the mints in India were closed) to the present year 1898, shows that the decrease of profits has been due more to the fall in price than to exchange. A few figures taken from the letter in question and from the very useful curves of prices, &c. appended thereto will make this clear, thus:—

	Tea per lb.	
1893—Average net* gold price in London - -	7·50	pence.
Cost of production† with rupee at 15*d.* - - -	4·28	„
(Exchange 15*d.*) profits per lb.	3·22	„
1895—Average net gold price in London - -	7·17	„
Cost of production with rupee at 13·3*d.* - - -	3·80	„
(Exchange 13·3*d.*) profits per lb. -	3·37	„

That is about the same profits as in 1893 though rupee had fallen 1⅔*d.*; and in this year if the price had remained the same (7½*d.*) as in 1893, the profits would have been 3·70*d.*, so that a fall in exchange of 1⅝*d.* (*i.e.*, from 15*d.* to 13·3*d.*) made a difference of profits, of only about ½*d.* per lb. of tea. The present year, further, shows the effect of the fall in price, thus:—

	Tea per lb.	
1898—Average net gold price of tea in London - -	6·30	pence.
Cost of production with rupee at 16*d.* - -	4·57	„
(Exchange 16*d.*) profits per lb. -	1·83	„

If the rupee had been at 15*d.* the profits would be only about ½*d.* per lb. more; and, if the rupee had been at the low figure (13·3*d.*) of 1895, the profits would be but ¾*d.* more per lb.

Or, the point may be put in other words in this way, the difference in profit per lb. between 1893 and 1898 is 1·39*d.*, of which only about ½*d.* is due to the rise in exchange from 15*d.* to 16*d.*, while the rest, over 1*d.*, is due to fall in price of tea. In fact a rise of 2*d.* in the exchange of the rupee makes a decrease of only ½*d.* in profits per lb. of tea, and has, therefore, only one-fourth the effect in diminishing profits that a fall of 2*d.* in the price would have.

It must, however, be noted here that many estates in Ceylon do not obtain for their tea the average price of 6·3*d.* last mentioned above: there are several whose tea nets little above 5*d.* per lb. The margin of profits in such cases approaches evanescence; and cultivation on those estates will probably have to be abandoned till prices chance to rise. A Ceylon correspondent lately informed me that a further fall of ½*d.* per lb. of tea in London would throw out of cultivation estates whose out-turn totals to about thirty millions of lbs. per annum; of course such a check to production would tend to cause prices to rise again, that is, if competition with China, a silver-using country, may not prevent such a rise in prices.

On the whole the tea industry in Ceylon, on which the prosperity of the colony depends, is in a critical condition at present. But, as regards the question of exchange, I do not see how the Colony can expect relief in that direction, because the interests of the great empire of India are paramount, and these require

* *i.e.*, 1½*d.* below the gross price shown in the curve appended to the letter.

† 126 million lbs. of tea are produced at a cost of 36 million rupees, this is a cost of 28⅝ cents. per lb. (100 cents. Ceylon = 1 rupee) and is practically independent of fluctuations in exchange.

that the gold value of the revenue shall be stable, at its present amount at the least, without the imposition of further taxation of the people; and the State must secure this object even though any private interests may suffer thereby.

The second chief argument in the Ceylon Association's letter is to the effect that the tea and other industries, that compete in other markets with the produce of China and other silver-using countries, will be so handicapped by the high value of the rupee as compared with that of silver, that those industries are likely to be extinguished in such a competition. In this the Association assumes that the present currency arrangements and those soon to be adopted in India will be continued in Ceylon. This argument so far as it affected the Indian plantations was fully considered by the Herschell Committee in 1893, who dealt with it in pars. 118–120* of their report. The Committee admitted to some extent the force of the argument, but doubted whether "any very serious prejudice would result" to Indian producers therefrom, and (in par. 120) dwelt on the want of railways and other means of communication in China, and the heavy imposts to which production is there subject; and thought therefore that no serious apprehension need be felt as to the competition of China.

The situation in China is, however, now very different from what it was when the Committee wrote: English factories with best machinery (as the Association points out) will soon turn out thence tea as well manufactured as any in India or Ceylon, and the want of transport will be overcome probably by railways; and I think that both Indian and Ceylon tea planters have much to fear from this competition while they use a rupee stable at about the rate of 16*d.* For instance, supposing both Ceylon and China teas to fetch a net price in London of 6*d.* per lb., this 6*d.* remitted to China will, at 27*d.* the ounce of silver, exchange for about 106 grains of pure silver there, while in exchange with India or Ceylon it is the equivalent of only 62 grains of the 165 which are in the Indian rupee; and thus, since price of labour, &c. has not responded to the change in value of the rupee, the London price will pay for nearly twice as much labour in China as it will in India or Ceylon. The China producer can therefore afford to sell his tea for two or three pence lower than the others; and, if the Chinese manufacture take the public taste, most of the Ceylon and Indian tea estates must be abandoned.

As above stated, the Association have assumed, in the above arguments that Ceylon will or must continue to use the Indian rupee and the gold standard if it be adopted presently by India. Of course it is, speaking generally, a great advantage to any country to have a currency not subject to depreciation or to fluctuations, sometimes violent, in exchange; and it may be here remarked that in 1893 the complaints of merchants and producers were directed more against the fluctuations in the rate of exchange than against the value of the rupee which then stood at about 15*d.*

But if Ceylon is, under present circumstances, content to use a silver currency however liable to variations in value and exchange, is there any formidable obstacle to her doing so, and to her giving up the use of the currency of her great neighbour? Since the occupation of Ceylon, in 1796, by the English, it has been always the case up to 1872 that the currency of the colony was different from that of India; and even when in 1872 the Indian rupee was adopted as the unit in Ceylon, the coin was decimalised there, and the use of the barbarous Indian sub-denominations of annas and pies was rejected. It will be remembered† that before 1825 the Ceylon currency was rix-dollars, coined at the mint in England, with sub-denominations of fanams and stivers. The rix-dollar was a silver coin, worth 1*s.* 5½*d.* with silver at 5*s.* the ounce. In 1825 the British currency was introduced, and accounts were directed to be kept in £ *s. d.*; and British silver and the rix-dollar (at 1*s.* 6*d.*) were declared by regulation to be legal tender to any amount. In 1835 the Indian Government made the Company's rupee of 165 grains pure silver and 15 grains alloy the standard for India; and in the following year the Governor of Ceylon, by notice (not an Order in Council or a Royal Proclamation), stated that the Covernment would put that rupee in circulation in Ceylon at the rate of two shillings.

This did not make the rupee legally current, but nevertheless it was universally accepted, and a debt expressed in British pounds was discharged in Ceylon by rupees at the rate of 10 to the £ as readily as by British currency or rix-dollars.

So it may be seen that, however natural it may be for Ceylon to use the same currency as India, history shows that it has generally not done so, and that it is possible for Ceylon again to use a different currency, and thus to compete on even terms with other silver-using countries such as China. Indeed this was the purport of the answer made by the Herschell Committee*, in 1893, to those who apprehended that Ceylon trade would be prejudiced by the closing of the Indian mints and by the adoption of a gold standard in India, if these currency arrangements should be continued in Ceylon. The Committee said, "it would in that event be open "to the Government of these colonies" (Ceylon and Mauritius) "to acquiesce in the action of India, or to "establish currencies of their own with or without "local mints."

The adoption of some such silver currency by Ceylon, even if it be to continue only for a time, would enable the Colony to tide over its present difficulties, so far as these have arisen from the action of the Indian Government, and to meet the competition of China with an even chance of success; and thus save the Colony from the disaster of the failure of the tea industry on which the prosperity of the whole island is very largely dependent.

It is unnecessary here to go into any detail as to the particular denomination of silver coin which Ceylon might adopt as the unit in such case. The Colony might use the British dollar of Singapore and Hong Kong, which seems to be fairly stable at an exchange value of 22 to 23 pence since Japan adopted a gold standard for her similar coin, the yen; or Ceylon might coin a rupee of her own, of same weight and fineness as the Indian one, but sufficiently distinct therefrom so as not to be mistaken for it, of which latter there would be little danger, for the natives of India and Ceylon are born money-changers. Whatever unit Ceylon may so adopt, Ceylon can pay the cost thereof by exporting to India such rupees as come to her treasury.

I may add that, after some consideration, and from my experience in connection with the details of the change of currency in Ceylon as carried out in 1871–72, I foresee no difficulty in the change now suggested greater, if not less, than the difficulties which were successfully overcome in those years under the government of Sir Hercules Robinson.

No. 48.

SHANGHAI: PRICES OF COMMODITIES.

(*Extract from a letter received from the Foreign Office.*)

Her Majesty's Consulate-General,
Shanghai, January 31st, 1898.

I now have the honour to forward a return showing the difference of price in terms of silver of 14 different articles as sold in the native market in the years 1887 and 1897. The list has been compiled from three separate and independent sources, and it represents, I believe, quite fairly the average retail prices in the native market.

In every case it will be seen that the prices have risen even in terms of "cash," and, *a fortiori*, in terms of silver. An office servant who was receiving $8 per month could convert these in 1887 into from 8,000 to

9,000 "cash," whereas now he can only get about 6,880, and, moreover, he finds that for nearly all the necessaries of life he must pay more "cash" than he used to.

In short, it may be said that at the present moment in Shanghai it requires at least $3 to procure the same articles of daily use as could formerly be procured for $2. It is, I think, probable that some of the articles quoted may be unduly appreciated at the moment from temporary causes, but, taking things all round, I am sure that there is a permanent rise of at least 30 per cent. in silver prices.

I have, &c.,
(Signed) G. JAMIESON,
Consul-General.

The Marquess of Salisbury, K.G.,
&c. &c. &c.

Enclosure to above.

COMPARATIVE TABLE of Retail Prices at SHANGHAI for YEARS 1887 and 1897.

In 1887 the value of the cash is taken at 1,000 per dollar.

In 1897 the average exchange was 860 per dollar.

No. 49.

COST of LIVING in CHINA.

(*Extract from a letter from Sir Claude MacDonald, H.M. Minister at Peking, received through the Treasury.*)

"Owing to the depreciation of silver and the dearness of copper cash, the silver pay of our Chinese employés of all ranks does not nearly represent the same purchasing power that it did some years ago, and the cost of living has consequently greatly increased. To meet this loss in the Customs Service Sir R. Hart has obtained sanction to raise the pay of all his Chinese employés by 50 per cent."

No. 50.

CURRENCY and PRICES in CHINA.

MEMORANDUM by MR. GEORGE JAMIESON, C.M.G., H.M. Consul-General at Shanghai.

The currency of China consists of—

A.—Silver, which is either—
1. Uncoined metal passing by weight.
2. Mexican dollars and British dollars.
3. Subsidiary coinage (decimal parts of a dollar).

B.—Copper cash.

A.—The standard of value is silver, the unit being the tael or Chinese ounce (565 grains).* All Government taxes are levied in taels, the Government accounts are kept in taels, so also are all native banking accounts, and practically all the wholesale trade of the country is carried on in this currency. For convenience, the metal is cast into ingots weighing about 50 taels each. This is done by a private assay office, which will give a certificate of weight and fineness. Government does not interfere in the matter at all. The volume of currency is thus the whole stock of silver in the country. It is added to or diminished by the mere fact of import or export. An importation of, say, half-a-million ounces in bar silver, can be converted into currency at a few hours' notice and at practically no cost at all.

The stock of uncoined silver is supplemented by Mexican dollars, and to some extent by the new British dollar coined in Bombay for the use of the Straits Settlements and Hongkong. Mexican dollars circulate at the open ports of trade and some distance inland, especially in the silk districts near Shanghai. They exchange freely against silver at their intrinsic value or rather better, the rate of exchange varying, however, as much as 3 or 4 per cent., according to the demand. All large transactions between foreigners and Chinese are conducted in silver—either taels or dollars, according to the custom of the port. In Central and North China it is exclusively taels.

For convenience there is now at the ports and vicinity a considerable circulation of small coins—50, 20, and 10-cent pieces. Most of these purport to be issued by the Hongkong Government, but they are really coined in England, and imported by the banks, like the Mexican and British dollars, for use among the people.

Mint machinery has recently been imported and set up at Canton and Wuchang—the capitals of two of the largest provinces. These institutions have tried to issue a coin, about identical in weight and fineness with the Mexican dollar, but the people have not taken to them. The coins have no advantage in paying power over imported Mexican dollars or uncoined silver, and as the cost of minting comes to more than is charged on the Mexican coin they cannot compete in intrinsic value with the latter. Only a small quantity has, I believe, been coined, and the business soon stopped, there being no profit in it.

There is, however, a profit in turning out subsidiary coins and considerable quantities of these continue to be issued. They run concurrent with the Hongkong coins at Shanghai and the other ports, and, I presume, to some extent in the interior where they take the place of copper cash.

There is no law of legal tender in China. Obligations are discharged in the currency in which they were contracted. If you borrow taels you must repay in taels. The price of a thing is so many taels, dollars, or copper cash as may be agreed on, and payment is to be made accordingly.

B. *Copper Cash.*—For all retail trade the medium of currency is the coin known to foreigners as the "copper cash." By regulation it ought to be of a minimum weight of $\frac{1}{10}$ of a tael or Chinese oz., and should contain 50 per cent. of pure copper, 41·5 per cent. of zinc, 6·5 per cent. of lead, and 2 per cent. of tin, also 1,000 should be equivalent to a tael in value. In practice none of these conditions are observed. The existing issues which go back, some of them for hundreds of years, contain coins of all degrees of inferiority, including a proportion of coins which are entirely spurious, yet they all pass current in a way, though sometimes with difficulty. A string of 100 will contain 50 to 60 good coins, 20 to 30 of inferior quality and 10 or 20 of the poorest kind. By custom there is a tolerance of a certain proportion of inferior coins—if more than custom tolerates is attempted, there will be trouble.

The right to coin these "cash" is vested in the officials. The authorities of each province are supposed to issue fresh supplies to meet the wants of the people, that is to say, to coin just so much as will keep the cash constant in relation to silver at the rate of 1,000 per tael. Whether this rate was ever maintained even approximately is doubtful; certainly it has not been so for the past 150 years. Presumably the authorities, finding it was profitable to coin at this rate, went on coining until the cash became so redundant that the price fell to nearly the intrinsic value when, of course, the issue would stop. And by reducing the weight and value of the coins to which there would be a natural temptation it was possible to continue the process and

* This is the weight of the ordinary tael of commerce at Shanghai. The Government or Customs tael is about 11 per cent. heavier. The commercial tael differs in different parts of the country, some being heavier some lighter than the Shanghai tael.

carry the depreciation much farther than would otherwise have been the case. The maximum period of depression appears to have been reached about 1850. According to one authority the following variations have taken place:—

In 1736 the Shanghai tael changed for cash				700
„ 1780	„	„	„	900
„ 1790	„	„	„	1,400
„ 1853	„	„	„	2,000
„ 1860	„	„	„	1,500

I give that for what it is worth, being unable for the moment to verify it further. But at all events for a number of years before and after 1860, the exchange fluctuated between 1,500 and 1,600 cash per tael. Since 1870 the following variations have taken place:—

Dec. 31st,	1870	1,560	Dec. 31st,	1893	1,380
„	1875	1,560	„	1894	1,330
„	1880	1,520	„	1895	1,330
„	1885	1,480	„	1896	1,200
„	1890	1,330	„	1897	1,250
„	1891	1,370	„	1898	1,190
„	1892	1,410	January	1899	1,190

What are the causes of this appreciation, how far are they permanent, and what will be the economic effect on the industry of the country?

Changes of the above nature in the relative value of silver and copper cash must be due to either—

A. An *increase* in the volume of silver currency in China, or

B. A diminution in the volume of copper cash currency either absolute or relative to the growing needs of commerce.

The first alternative may be at once excluded.

The following table shows the Import and Export of Merchandise and Bullion since 1888:—

I.—Merchandise.

Year.	Value in Haikwan Taels (000's omitted.)		Balance.	
			+	−
	Imports. H. Taels.	Exports. H. Taels.	H. Taels.	H. Taels.

Total 10 Years		82,313,000	59,594,000	13,406,000
Net Export of gold H. Taels				59,594,000
„ Import of silver				68,907,000
The adverse balance of Trade against China by Table I. is			H. Taels	94,824,000
This is reduced by Export of gold				59,594,000
To				35,230,000
Add net Import of Silver				68,907,000
Total adverse balance				104,137,000

which is made up by the recent Government loans on the foreign market, that is, by the total of the various loans since 1894, about 350 million taels, less the Japanese indemnity of 230 millions.

The years 1894–95 no doubt showed a large import of silver which would, in the usual course of things, go somewhat to swell the volume of silver currency, but this import was quite exceptional and unwarranted by the balance of trade either before or after. Moreover as the borrowings of China will in the future entail an annual payment to Europe of about taels 25,000,000 per annum it is manifest that, unless the course of trade greatly changes, there can be no great import of silver for a long time to come. The conclusion, therefore, is that as regards the cash currency the appreciation of the latter cannot have been caused by the superabundance of silver in the country.

The explanation must, therefore, be sought in the alternative cause, viz., a diminution of the cash currency either absolute or relative to the wants of the commercial community. So far as my information goes there has been a diminution, firstly, absolute, by the melting down of some of the full-weighted and better class of coins; and, secondly, relative, by a cessation of the coinage. The evidence I collected in Shanghai tended to show that there has been going on for some years a process whereby the best coins were being abstracted from the currency and melted down for the sake of the copper they contained.

This would be possible only if there was a sufficient rise in the price of copper in terms of silver as compared with the rates prevailing at the time of coinage. Without troubling the Committee with details of the calculation I present the following table as showing the intrinsic value or melting point of copper cash during the last 28 years. It is only for selected coins of best quality, 1,000 of which weigh on an average 8 lbs. 4 ozs. avoir., and on the assumption that the composition is up to standard. The price of copper is the local wholesale price in Shanghai as stated in the Customs Returns, but coincides closely with the prices of copper and silver as given in Sauerbeck's Tables:—

Year.	Price of Copper per lb. in Tael Cents.	Intrinsic Value, or Melting Point.*
1870	12·56	Tael 1 = Cash 1,527
1875	13·65	„ „ 1,396
1880	12·58	„ „ 1,466
1885	11·12	„ „ 1,656
1890	12·38	„ „ 1,568
1891	10·82	„ „ 1,573
1892	11·55	„ „ 1,488
1893	12·??	„ „ 1,419
1894	12·04	„ „ 1,402
1895	15·02	„ „ 1,262
1896	13·78	„ „ 1,308
1897	16·60	„ „ 1,085

* *Note.*—In making the calculation the price of zinc as well as that of copper is taken into account.

This table shows that while there could have been no great temptation to melt down cash during the period 1880 to 1894 there undoubtedly has been such an inducement since that year—an inducement which would be strengthened by a further rise in the price of copper, such as seems to prevail at the present moment, unaccompanied by a corresponding rise in the price of silver.

On the other hand a counteracting influence has been set at work in the resumption of the coinage of copper cash, to the stoppage of which I mainly attribute the appreciation. This appreciation gave rise to numerous complaints and several of the provincial mints which had not been working for years have commenced to issue cash but of an inferior intrinsic value. A string of 1,000 of those new cash weighs only about 5 lbs. 8 ozs. as against 8 lbs. 4 ozs. of the older standard sort, so that assuming they contain the same proportion of copper

their value would be 33 per cent. below standard. At this rate it, no doubt, pays the officials sufficiently well, and it may be presumed that they will go on coining until the exchange value in terms of silver again touches melting point. At the same time the operation of abstracting and melting down the superior coins may go on, their place being taken by the inferior coins from below. If the supply of the latter be sufficient this result must follow under the operation of the Gresham Law.

For the moment, at all events, the appreciation of cash seems to have been arrested, for it has remained steady at about 1,200 per tael since 1896, and if the mints continue working it is more than likely that the reverse process of depreciation will set in, which may, in time, bring back cash and silver to the old relative value.

From the above it will be seen that this cash currency forms a mongrel sort of standard of value of its own. It is not a token coin, for it does not represent any fixed weight of silver, though it was apparently intended it should. Nor is it a standard based on copper, or on copper and zinc, for its composition is not uniform, and, moreover, there is not free coinage. But inasmuch as it plays an indispensable part as a medium of exchange in the interior of the country, quite independent of silver, it would seem to follow that a contraction, either absolute or relative, must have its usual effect in lowering wages and prices generally in its own terms. If it did not, then, inasmuch as cash rose in terms of silver between 1870 and 1894 by about 15 per cent. it follows that the purchasing power of silver must have fallen to an equal degree. But it is quite certain that up to 1894 or 1895 there was no perceptible rise of silver prices in China. Since 1895 there has, no doubt, been a rise in numerous articles of export, mainly owing to the fact that sterling prices have been firmer in foreign markets, a rise which in time would be reflected in cash prices of these articles in the interior. Apart from that, I think it is reasonable to conclude, though I can offer no statistics, that the long continued complaint of the dearness of cash must have tended to cheapen commodities. Rather the contrary, it is true, has been observed in Shanghai, as will be seen from my report on the rise of prices there referred to in Mr. Christie's evidence (Question No. 4623). As to that, I would only say that prices (meaning retail prices) in a busy corner like Shanghai must not be taken as representative of China generally. Their influence would not be felt 100 miles in the interior. That report was written merely as a guide in fixing the fair wages in silver of servants in the public offices at Shanghai, and did not go beyond what, for the time being, was current there.

From the point of view of industrial competition, the conclusions to be drawn are that, as the rise in the silver value of cash since 1893 has been about 13 per cent., the purchasing power of silver in China may have fallen by that per-centage during the same period, but only if we suppose that the whole burden of the change has been thrown upon silver, *i.e*, assuming that cash prices have not varied. And as regards the future, unless the price of copper rises permanently in terms of silver, there seems no reason to anticipate a further enhancement of cash or consequent diminution in the purchasing power of silver, and should the rise in copper be permanent, its effect may be counteracted by the fresh issue of depreciated cash.

G. JAMIESON.

London, February 22, 1899.

Papers relating to JAPAN.

No. 51.

TEXT OF THE NEW COINAGE LAW OF JAPAN, (1897).

(From the 27th Mint Report (1896), (C. 8507).)

ART. I.—The power of minting and issuing coins belongs to the Government.

ART. II.—A weight of 2 fun (11·574 grs.) of pure gold shall be the unit of coinage, which shall be called a *yen*.

ART. III.—The varieties of coin shall be as follows:—

GOLD COINS.

Pieces of 20-yen, 10-yen, and 5-yen.

SILVER COINS.

Pieces of 50-sen, 20-sen, and 10-sen.

NICKEL COINS.

Pieces of 5-sen.

BRONZE COINS.

Pieces of 1-sen, and 5-rin.

ART. IV.—The decimal system shall be adopted for purposes of currency calculation. The hundredth part of a yen shall be called a sen, and the tenth part of a sen shall be called a rin.

ART. V.—The composition of the coins shall be as follows:—

GOLD COINS.

900 parts of pure gold to 100 parts of copper.

SILVER COINS.

800 parts of pure silver to 200 parts of copper.

NICKEL COINS.

250 parts of nickel to 750 parts of copper.

BRONZE COINS.

950 parts of copper, 40 parts of tin, and 10 parts of zinc.

ART. VI.—The weights of the coins shall be as follows:—

——	Momme.	Grammes.
The 20-yen gold piece - -	4·444	(16·6665)
The 10-yen gold piece - -	2·222	(8·3333)
The 5-yen gold piece - -	1·111	(4·1666)
The 50-sen silver piece - -	3·5942	(13·4783)
The 20-sen silver piece - -	1·4377	(5·3914)
The 10-sen silver piece - -	0·7188	(2·6955)
The 5-sen nickel piece - -	1·244	(4·6654)
The 1-sen copper piece - -	1·9008	(7·1280)
The 5-rin copper piece - -	0·9504	(3·5640)

ART. VII.—Gold coins shall be legal tender to any amount. Silver coins shall be legal tender to the amount of 10 yen. Nickel and copper coins shall be legal tender to the amount of one yen.

ART. VIII.—The dimensions of the coins shall be fixed by Imperial Ordinance.

ART. IX.—The legal remedy of fineness shall be $\frac{1}{1000}$ in the case of gold coins, and $\frac{3}{1000}$ in the case of silver coins.

ART. X.—The legal remedy of weight shall be as follows:—

20-yen gold coin; 0·00864 momme (0·0324 grammes); or 0·83 momme (3·1125 grammes) in 1,000 pieces.
10-yen gold coin; 0·00605 momme (0·02269 grammes); or 0·62 momme (2·325 grammes) in 1,000 pieces.
5-yen gold coin; 0·00432 momme (0·0162 grammes); or 0·41 momme (1·5375 grammes) in 1,000 pieces.

In the case of the silver coins the legal remedy of weight shall be 0·02592 momme (0·0972 grammes) for each piece; or 1·24 momme (4·65 grammes) in each 1,000 pieces of 50-sen; 0·83 momme (3·1125 grammes) in each 1,000 pieces of 20-sen; and 0·41 momme (1·5375 grammes) in each 1,000 pieces of 10-sen.

ART. XI.—The minimum circulating weights of the gold coins shall be as follows :—

	Momme.	Grammes.
20-yen gold coin - - -	4·42	(16·575)
10-yen gold coin - -	2·21	(8·2875)
5-yen gold coin - - -	1·105	(4·1438)

ART. XII.—If, in consequence of friction from circulation any of the gold coins fall below the minimum circulating weight, or if any of the silver, nickel, and copper coins becomes visibly reduced owing to the same cause, or, if any coins become inconvenient for purposes of circulation, the Government shall exchange such coins for others of the same face values, without making any charge.

ART. XIII.—If the design upon a coin becomes difficult to distinguish, or if it has been privately restamped, or otherwise defaced, it shall be regarded as unfit for circulation.

ART. XIV.—Should any person import gold bullion and apply to have it minted into gold coin, the Government shall grant the application.

ART. XV.—The gold coins already issued shall circulate at twice the value of the gold coins issued under the provisions of this law.

ART. XVI.—The silver 1-yen coins already issued shall be gradually exchanged for gold coins, according to the convenience of the Government, at the rate of one gold yen for one silver yen.

Pending the completion of the exchange referred to in the last paragraph, silver 1-yen coins shall be legal tender to an unlimited extent, at the rate of one silver yen for one gold yen; and the suspension of their circulation shall be notified six months in advance by Imperial Ordinance. Any of these coins not presented for exchange within a period of five full years, reckoned from the day on which their circulation is suspended, shall be regarded thenceforth as bullion.

ART. XVII.—The five-sen silver coins and the copper coins already issued shall continue in circulation as before.

ART. XVIII.—From the day of the promulgation of this law, the coinage of 1-yen silver pieces shall cease; but this restriction shall not apply to silver bullion entrusted to the Government for coinage prior to that day.

ART. XIX.—All previous laws or ordinances conflicting with the provisions of this law are hereby rescinded.

ART. XX.—With the exception of Art. XVIII., this law shall go into operation from the first day of the tenth month of the 30th year of Meiji (October 1st, 1897).

NOTE.—*From the above it will be seen that the new gold yen will contain half the weight of pure metal of that hitherto issued under the law of* 1871, *and the ratio of gold to silver will be as* 1 *to* 32·348.

No. 52.

REPORT on the working of the GOLD STANDARD in JAPAN.

(*Received through the Foreign Office.*)

The law substituting the gold standard for the silver standard came into force October 1, 1897.

There are three points on which Her Majesty's Secretary of State for India desires information.

(*a.*) Freedom or restriction of conditions under which the public can, if they wish, withdraw gold from the State Bank for exportation.

(*b.*) The extent to which gold is being put into circulation among the community generally.

(*c.*) How far there is, in Japan, any apprehension among business men that gold will leave the country.

As to (*a*) there is absolutely no restriction upon the withdrawal of gold for exportation.

As to (*b*) the Japanese people have for the past thirty years used bank notes and small subsidiary coins, silver, nickel, and copper in making payments, and the habit has become so ingrained in them that there does not seem to be any likelihood of their taking to the use of gold coin in place of notes. It has even happened that paper has been at a premium as compared with coin.

According to statistics recently published in the Government Gazette, the amount of coin in circulation on October 1, 1897, was estimated at 85,397,415 *yen*, of which 5,622,354 *yen* was in gold. (*See* Annex A, Coin in circulation.)

The corresponding figures at the end of January 1898 were 92,329,664 *yen*, of which 16,554,429 was in gold. At the end of February these figures were estimated at 94,706,854 *yen* and 17,369,987 *yen* respectively, and at the end of March the coin in circulation was estimated at 99,602,230 *yen*, of which 15,898,313 *yen* was gold.

Of the amount of gold in circulation, it is calculated that 10,000,000 *yen* may be in the possession of national and private banks, the rest being in the hands of private individuals. This latter amount can only be kept for hoarding, as it is not seen passing from hand to hand among the people.

As to (*c*) business men apprehend that gold will leave the country, and the Japanese authorities entertain the same apprehension.

On October 1, 1897, when the gold standard came into effect, the quantity of gold (including coin and bullion) in the possession of the Treasury and the Bank of Japan respectively was in round numbers.

	77,390,000 *yen*
	84,013,000 *yen*
in circulation	5,622,354 *yen*
	167,025,354 *yen*

On April 1 these figures were respectively

	49,722,123 *yen*
	73,296,104 *yen*
	15,898,313 *yen*
	138,916,540 *yen*

showing a decrease of 28,108,814 *yen*.

This corresponds very closely with the amount believed to have been exported during the six months that have elapsed since October 1, 1897.

The following are the monthly statistics taken from the Customs returns :—

1897—October - - -	2,001,732
November - -	4,200,846
December - - -	2,550,936
1898—January - - -	4,516,400
February - - -	4,840,056
March - - -	10,933,972
	29,043,942
Less amount imported during the same period - -	821,749
	28,221,193

The figures include the amount sent away by parcel post, which is estimated at 3,000,000 (*see* Annex C).

By article XVI of the Coinage Law of which a translation* was enclosed in Despatch No. 44 of March 3, from Her Majesty's Legation to the Foreign Office, it is provided that the silver coins in circulation shall be gradually exchanged for gold coins. The amount thus given out in exchange for silver during the six months from October 1, 1897, to March 31, 1898, was $32,480,245. During the same period a further sum of $31,606,709 was exchanged for notes, making in all $64,086,954, but from this must be deducted $13,817,213, being the amount of gold received for notes and silver *yen*, the difference being $50,269,741.

It was anticipated that silver *yen* would be imported from abroad for the purpose of obtaining gold in exchange. As is well known these coins are legal tender in the Straits Settlements, and a large quantity has been absorbed by Hong Kong and China. The total amount exported up to January 1897 reached 112,000,000 *yen*, and it was estimated that 35,000,000 silver *yen* might come back to this country. The amount actually imported during the six months has, however, been only 8,140,578 silver *yen*.

The Japanese Government has lying to its credit in London a sum equivalent to 31,935,107 gold *yen* and

* See *supra*, No. 51.

expects to receive from China on or about 8th of May next the balance of the war indemnity, amounting to 12,008,857*l.*, when a sum of something over 15 millions sterling in all will then be at the disposition of the Japanese Government. But of this a large portion will be required for payments abroad for ships, guns, and machinery ordered or purchased by the Government.

If the present rate of gold export be continued during the next two years nearly the whole of the existing stock of gold in the country will be exhausted. And as the payments which have to be made abroad on account of ships, guns, machinery, and so forth during the next five years are very large, some means, it is felt by the Japanese Minister of Finance, ought to be adopted to check the outflow of gold. (*See* annexed Statement D.) Already the rate of interest on loans of the Bank of Japan has been raised to 8¾ per cent., and that of discount to 9½ per cent. The example of the Bank of Japan has been followed by the other banks. Some of the latter in order to attract deposits offer 7 per cent. on 12 months' deposit and from 5 to 6 per cent. on current accounts. Whether these high rates will have the effect of checking the drain of gold seems to be doubtful, and in the belief of some financial authorities the action of the Bank of Japan has been solely with the view of reducing its note issue; which, according to a statement of the president of the bank on February 20th last, then stood at 226,220,000 *yen*; or was 47,310,000 *yen* in excess of the limit allowed by its charter.

The latest report of the Bank of Japan (for April 18–23, 1898), however, gives the following figures:—

66,852,288 *yen* issue against gold reserve.
112,909,745 *yen* issued against securities.

Total 179,762,033, showing a considerable decrease.

The limit allowed by charter is 85,000,000 against securities, and this was exceeded by 31,214,489 *yen* during that week.

Since 1896 the balance of trade has been against Japan. In 1896 it was 53,831,740 *yen*; in 1897 56,165,694 *yen*; in 1st quarter of 1898, 31,910,055 *yen*.

To a very large extent this balance has been met by bills drawn against the Government reserves lying in London.

The adverse balance has in a great measure arisen from the sudden development of the railway system, the expansion of the cotton spinning industry, and the increase of merchant shipping. Various municipal undertakings, especially the improvement of the water supply in the chief towns, have also necessitated large expenditure in Europe.

A.

Amount of Coin in Circulation on September 30, 1897.

Amount.—85,397,415*yen* 34 *sen* on September 30, being an increase of 668,349 *yen* 82 *sen* 8 *rin* over the preceding month, and of 11,851,303 *yen* 24 *sen* 6 *rin* over the corresponding period of previous year.

These figures are shown as follows:—

Description.	In circulation at end of September.	Increase over previous month.	Increase on corresponding month of last year.
Gold - -	5,622,354 442	194,432 128	143,141 474
Silver:			
1 yen and trade dollar -	37,525,036 000	347,434 000	7,565,299 247
50 sen and under -	26,272,993 550	126,808 700	3,634,710 100
Total -	63,798,029 550	474,242 700	11,190,009 347
Nickel -	6,626,078 400	225	554,663 200
Copper -	9,350,952 848	100	36,510 775
Total -	85,397,415 340	668,349 828	11,851,303 246

Amount of Coin in Circulation in 1898.

On January 31 the amount of coin in circulation was 92,329,664 *yen* 94 *sen* 2 *rin*, being an increase of 564,407 *yen* 51 *sen* 4 *rin* over the preceding month, and of 11,809,239 *yen* 80 *sen* 6 *rin* as compared with the same month of the preceding year.

On February 28 it amounted to 94,706,854 *yen* 9 *rin*, an increase of 2,377,189 *yen* 6 *sen* 7 *rin* over the preceding month, and of 13,973,744 *yen* 70 *sen* 2 *rin* as compared with the same month of the preceding year.

The above figures are explained by the following table:—

Amount at end of January 1898.

Description.	In Circulation at end of January.	Increase over preceding month.	Increase over corresponding month of last year.
Gold - -	16,554,429 194	20,149 486	5,765,571 094
Of which old gold coin -	11,064,082	—	—
Silver:

No. 53.

INFORMATION from the OFFICER ADMINISTERING the GOVERNMENT of the STRAITS SETTLEMENTS as to the action taken by JAPAN in regard to the YEN.

Downing Street,
November 28, 1898.

SIR,

I AM directed by Mr. Secretary Chamberlain to transmit to you to be laid before the Indian Currency Commission, copy of a despatch from the Officer Administering the Government of the Straits Settlements explaining the action taken by the Japanese Government in regard to the Japanese dollar or yen since the adoption of a gold standard in that country.

I am, &c.

R. Chalmers, Esq.,
Secretary to Indian
Currency Committee,

C. P. LUCAS.

Government House, Singapore,
14th October 1898.

SIR,

I HAD the honour to receive from you on the 11th instant the following telegram :—

"Referring to your telegram of 1st October it is understood that your apprehensions are due to importation of defaced coin, and that clear yen still continue to disappear from circulation. If so, it appears to me that difficulty would be met by notice drawing public attention to clause 4, sub-section 4, of Order in Council of 2nd February 1895."

2. I ought to explain that the Japanese yen already in circulation here, as well as those recently imported, are all clean coin, scarcely showing signs of being used ; I have never come across a single worn coin.

3. Clear yen are not disappearing from circulation, but quite the reverse.

4. Japan last year adopted a gold standard at a ratio with silver of $32\frac{1}{3}$ to 1, on the hypothesis that silver had then almost attained its minimum value in terms of gold, 32·29 to 1 having been the ratio for the first nine months of 1897. The following remark was made at the time :—

"The silver yen now in circulation will be maintained at par with the gold yen by the Government being prepared to redeem them in gold whenever called upon to do so. In this connection it is important to note that there are about 140,000,000 of Japanese silver yen in circulation, of which it is estimated that about 70,000,000 are in circulation as money in China, and the English, French, and other colonies and settlements in the East. U. S. Mint Report, 1897 page 350.

"Should the rate between gold and silver become greater than 1 in 32 the tendency would seem to be to

drive the outstanding silver coin back to Japan for redemption."

Count Matsukata, introducing the Bill on 3rd March 1897, is reported to have said:—

"The present one yen silver:—This silver coin has passed as legal tender unlimitedly since 1878, and, therefore, it is necessary to allow a certain time before it is called in. The Government, while giving such an allowance, intends to withdraw it from circulation as soon as it is possible to do so. . . . . The one-yen silver exported from this country amounts to a very large sum; the total of such export up to January last has been more than 112 million yen. It is, therefore, asked whether the one-yen silver will not be re-imported and gold taken away? . . . .

p. 360. "Investigations which have been made *loco citato* show that except those circulating in Hongkong and Singapore it is very rare to find undamaged pieces amongst the exported one-yen silver. As they are now useful in daily transactions abroad there will not be many people coming out here to exchange them for gold, as silver is valued lower than at present in the proposed monetary law. There is, therefore, no need of entertaining a fear in this connection."

* * * * *

5. The Japanese currency law contained the following article:—

"XVI. The silver one-yen coins already issued shall be gradually exchanged for gold coins according to the convenience of the Government at the rate of one gold yen for one silver yen.

"Pending the completion of the exchange referred to in the last paragraph silver one-yen coins shall be legal tender to an unlimited extent at the rate of one silver yen for one gold yen, and the suspension of their circulation shall be notified six months in advance by Imperial Ordinance. Any of these coins not presented for exchange within a period of five full years from the day on which their circulation is suspended, shall be regarded thenceforth as bullion."

Article XX. ". . . . This law shall go into operation from 1st October 1897."

6. Count Matsukata's anticipations were not fulfilled. Silver declined till its ratio to gold was as 40 to 1, and, as predicted in the quotation in paragraph 4, the outstanding silver was driven back to Japan for redemption.

In 1897 the Colony exported to Japan and Hongkong:—

	$
From Singapore - -	4,597,144
From Penang - -	2,324,366

In the first quarter of 1898 the Colony exported to Japan:—

	$
From Singapore - - -	251,500
From Penang - - -	440,550

During the second quarter:—

	$
From Singapore - - -	142,000
From Penang - - -	131,900

Some exports to Japan are probably included in the following statistics of export for Hongkong:—

First quarter, from—

	$
Singapore - - -	359,850
Penang - - -	45,650

Second quarter, from—

	$
Singapore - - -	588,400
Penang - - -	414,000

7. This result has seriously embarrassed the Japanese Government.

I annex an extract from the "Financial News" showing what unjustifiable means they adopted to check the drain of gold.

According to a recent article in the "Japan Mail," the authorities there calculated on the 31st July last, that 26,150,471 silver yen remained still unchanged on the 31st July.

These silver yen, which include those rejected on frivolous pretexts by the Japanese Government, are now seeking an outlet. In Japan their value has fallen to 87·1 sen, or nearly 13 per cent. below the value realised by those exchanged for gold.

8. But this is not all. In the course of exchanging, the Japanese Government has accumulated an immense stock of demonetised silver yen for which it has no immediate use, and it was strongly tempted some time ago to send 50 millions abroad for circulation south of Hongkong. It was in anticipation of some such step that my despatch No. 147 of 13th May last was written.

9. My telegram of the 1st October will have shown that the re-importation of Japanese yen has begun on a large scale. From six to two months ago hardly a single one was to be found in circulation here, now they are becoming quite common again, and the minting of British dollars at Bombay has almost entirely ceased, because it is cheaper to buy in Japan discarded Japanese dollars and import them here.

10. The Executive Council considered the subject on the 12th October, and advised me that in this case such urgent necessity existed that I should be justified under Article XXV., clause 4, and the proviso to the article, in immediately passing without a suspending clause the draft Ordinance, copy of which was enclosed in my despatch No. 306 of the 12th.

I accordingly despatched to you the reply telegram contained in my despatch of the 12th instant.

I have, &c.
J. A. SWETTENHAM.

The Right Honourable
Joseph Chamberlain, M.P.,
&c., &c., &c.
Colonial Office.

A GOLD STANDARD IN DIFFICULTIES.

A correspondent writes to the "Financial News":—

"There is much complaint in Japan with regard to the treatment which is being accorded to the unfortunate holders of silver yen by the Japanese Government. Every possible method has been adopted to evade the obligation under the new currency Act to redeem them in gold. The most frivolous pretexts have been resorted to, a mere scratch on the surface of the coins, or the slightest abrasion, being considered sufficient excuse for refusing to accept them as decreed under the Act, although coins in circulation must necessarily become more or less scratched, and the coins in question, moreover, are destined to be melted. The paltry expedients, remarks a Yokohama authority, which never could amount to anything of consequence, are altogether exceeded by the introduction of a Bill which passed the House of Peers on June 4th, reducing the unexpired original period of five years to less than two months, so that after July 31st exchange will be refused altogether. By this means the Government hopes to stop the efflux of gold from the Treasury.

"Meanwhile, the state of financial affairs gets worse. Take the ruling rate for money as an example. The Japanese Minister of Finance has just published some interesting details concerning the rate of interest in Japan. The rate has been on the increase for several months past, and now reaches in certain provinces 18 to 19 per cent. for loans granted by banks. The average for the whole country is 12 to 15 per cent. The interest on deposits by the same banks is naturally much lower, never attaining more than 7 or 8 per cent., but that is high enough to indicate a deplorable lack of private enterprise.

"Of course it must be remembered that owing to the frivolous action of the Government alluded to above, bankers who are wide-awake in their calling are sending in within the limited period named for exchange every silver yen they can lay hands on, so as to diminish the consequence of the change of policy which the Government has so suddenly adopted, which will have the effect of, in some measure, by not giving time enough for the collection of yen and their transmission here to be exchanged for gold, choking off the demand. At the same sitting of the Upper House, a Bill passed through all its stages for limiting the present paper currency to December 31st, 1899. It is presumed that other paper money will be issued to take its place, since the reason alleged for the measure was that 'most of what is in circulation is defaced or 'torn.' It is contended that the sudden limitation of the period within which the silver yen will be received at the Japanese Treasuries practically amounts to an act of repudiation on the part of Japan. The yen were accepted originally as Japanese legal tender money, and the Japanese Government has not only lowered the value of the coin as bullion by its action, but now refuses to recognise the coin itself as money after a period too brief to allow of its presentation for redemption at its face value."

No. 54.

CURRENCY OF THE STRAITS SETTLEMENTS.

Downing Street,
SIR, 18th November 1898.

I AM directed by the Secretary of State for the Colonies to transmit to you, to be laid before the Indian Currency Committee, the enclosed copy of a despatch from the Governor of the Straits Settlements relative to the Currency of that Colony.

I am, &c.,
C. P. LUCAS.

R. Chalmers, Esq.

Enclosure above referred to.

Government House, Singapore,
SIR, 9th March 1898.

I HAVE the honour to forward a copy of a letter received from the Chamber of Commerce, Singapore, together* with certain resolutions put at a special general meeting of the Chamber held on the 13th January on the subject of the Straits Currency. I also forward copies of the enclosures to the letter, together with a memorandum by the Acting Colonial Treasurer, and a copy of the "Straits Times" of the 26th January last, which contains the reported opinions on the subject of Straits merchants now resident in England.

2. It will be seen that a considerable diversity of opinion exists among the mercantile community as to the steps which should be taken to remedy the existing state of affairs, which, by reason of the constant fluctuation in the exchange value of the dollar, is admitted to be prejudicial to trade.

3. The scheme set out in the report of the sub-committee of the 6th November is put forward, it will be observed, not as a perfect or complete one, but as a basis for a scheme to be worked out by the Government. It is one to which, in the words of one of the members of the sub-committee, they were in no way wedded, being merely tentatively put forward before the Chamber (page 25 of proceedings).

4. This being so, it might appear to be unnecessary for me to criticise in detail a scheme which is submitted under these conditions, especially as very full criticisms are contained in the enclosures to this despatch. But as the scheme is one which is put forward as a basis on which to work, I am bound to mention some serious objections which it contains, and which would make an attempt to work it on the lines suggested as dangerous to the public revenue as it would be to the trade of the colony.

5. In the first place, the scheme is silent as to the cost of the experiment, and as to the risks and difficulties to be met in carrying it out, or as to the penalty for failure. With a moderate estimate of only $10,000,000 to be dealt with, the initial cost of providing one dollar notes for use between the time of the demonetisation of existing dollar pieces, and the issue of the new token dollars would be large (say $500,000), while the loss to Government by giving in exchange for dollars (at exchange say of 1*s.* 10½*d.*) something worth 2*s.* would be about $700,000. There must be added the interest on the "Temporary Sterling Loan" referred to by the Sub-Committee, which according to paragraph 59 of their Report, would in the meanwhile have to be raised. The amount of this loan would necessarily be a large one, possibly at first for the full amount of the silver withdrawn from circulation, for if the colony were to undertake a token currency, it would be under an obligation to maintain its value, and to guarantee that when gold is asked for in exchange for token coins, it will be forthcoming at the ratio fixed.

6. As to the manner in, or extent to, which the public revenue would be recouped for the initial expenditure the report gives little information. Apparently the only direct profits might arise from the recoining of the discarded silver into token dollars, supposing that a new coin of considerably decreased intrinsic value was approved, and that the price of silver did not advance. But the Sub-Committee in paragraph 59 of their report suggest that only a limited number of Straits subsidiary dollars should be coined, the balance of the demonetised silver being sold as bullion at a loss.

7. This suggests a very important point of the whole question, *i.e.* to what extent the token dollars would be legal tender. The report of the Sub-Committee is silent as to this, purposely silent, according to one of its members (page 27 of proceedings), who also stated that it would be quite unnecessary for them to have subsidiary dollars to any considerable extent. This is unfortunate, as the meaning of the proposed scheme turns to a great extent upon this. If there is to be a limit of legal tender, the scheme would mean, not putting the dollar on a gold basis, but introducing a gold currency. I think the Committee would have made their meaning clearer if they had avoided the use of the word "dollar" in their suggestions as to the changes to be effected.

8. But any attempt to establish a gold currency in the Far East is out of the question, not only because, as pointed out by Sir David Barbour in his minute on the report of the Indian Commission, gold coins would in practice be of too great value to suit the vast majority of transactions, but because of the great cost and risk of introducing a large stock of gold, even supposing that the world's supply of gold were sufficient.

9. The Sub-Committee, when they suggest that only a limited number of token dollars be coined, do not intimate in what form the notes meanwhile issued by Government in lieu of the discarded dollars should be redeemed. Obviously not in token dollars, for there would be an insufficiency as only a limited number would be coined. Apparently then in gold, which would be a costly or at least a very speculative operation for the Government to undertake.

10. The proposal of the Sub-Committee that the token dollars should be only of from 60 to 75 per cent. of the weight of existing standard coins cannot be passed over without remark. Any sudden change in intrinsic value of the coin which has for generations been the standard of value in the Far East should, if possible, be avoided. A reduction in weight must be regarded by the natives with distrust, and in the neighbouring countries or islands with which we trade, and where silver *per se* is looked on as the measure of value, it would certainly be repudiated. No native coming to our shores to trade would be content to receive payments of silver reduced in weight by say 25 per cent. With regard to this point, the following remarks of the late Sir William Maxwell, who was President of the Currency Commission of 1893, may be of interest; speaking of the dollar he describes it as "the medium of exchange in the eastern seas ever "since merchant adventurers from Europe taught "native producers that Spanish dollars could be safely "received as the equivalent of a certain weight of "fine silver" (page 45). "The Chinese trader does "not understand occidental views of currency. He is "accustomed to weight, not tale, and to him a silver "coin is a piece of silver which has only intrinsic "value" (page 48).

Mr. Craig, a witness before the same Commission (page 36), stated "so long as we are on the outskirts "of and surrounded by countries using different "dollars, all of which come to Singapore, we should "do nothing to spoil our trade, and I think that if we "make any change to a sterling basis, to the prejudice "of the dollar, we shall spoil our trade with silver "using countries."

And Mr. Murray (page 31 of printed proceedings of Currency Commission) expressed the opinion that silver coins with a fictitious value for circulation in the Straits could never be sent out of the Colony.

It is true that a portion of the demonetised coin is expected to remain in or come back to the Colony (*see* page 26 of proceedings), but so long as the token dollar was the only legal tender, so long would traders be bound to accept it and, in the event of the already existing dollar coinage attaining an exchange value of above 2*s.*, it would be in the interest of purchasers to pay in the less valuable medium. How far it is possible for two currencies, one consisting of accommodation money for the bulk of transactions with outlying countries and subject to fluctuations in value, the other of a limited number of token coins of a fixed ratio with gold, to co-exist, it is difficult to say. It does not seem that the result would be what is apparently desired by the Sub-Committee, a gold currency pure and simple (pages 11 and 26 of pro-

* Enclosures not printed.

ceedings). The opinions of some of the witnesses at the Currency Commission of 1893 may be worth quoting in respect of this point.

Mr. Edelman (page 16) said "In my opinion, if the "use of dollars for trade transactions is not pro- "hibited in this colony, any change in the currency "would be a dead letter." Mr. Allinson (page 18) said "If it was left open for people to make contracts in "other dollars, the change of currency would be a "dead letter."

11. Of course, if the intrinsic value of the new token dollar were to be only a little below its nominal value, Government could make little profit out of coining them, and in the event of the intrinsic value rising above 2*s*. the coin would naturally leave the colony.

12. These risks and others, such as the danger to our native trade by having a period without sufficient currency, the risk of counterfeiting coin of a low intrinsic but nominally high value, have been dealt with in the criticisms on the Sub-Committee's report, and I need hardly refer to them here.

The last named danger might prove to be a very serious one. A similar risk was considered when the Indian mints were being closed, but in this colony the circumstances would be very favourable to successful fraud. In India the strict customs examination would prevent the extensive importation of counterfeit money; in the colony there is no customs examination.

In the case of India the coining would have to be effected in that country, not only because of the customs examination but because Indians could not carry on, in a foreign country, operations of the required magnitude without arousing suspicion.

In the Straits, on the other hand, the bulk of the population are aliens, in easy communication with their fellow countrymen in China, whence counterfeit coins might be imported to an almost unlimited extent. This danger has been made evident by the very large scale on which the Netherlands Indian Currency has been counterfeited. No Treasury could risk having to pay away gold for coins of much less intrinsic value on which it had previously made no profit.

13. I do not consider that the procedure of the Government, suggested in paragraph 59 of the report, as to the manner of demonetising existing coinage is feasible or defensible. The Government could not take the step without the fullest preparation, which would certainly include the consultation of all parties interested and the fullest debate in council, not to speak of the actual arrangements and means for effecting the conversion which would have to be carefully worked out. This is apparently acknowledged by the Sub-Committee in the closing portion of paragraphs 56 and 59 of their report. This is the view taken by the Indian Government in its despatch to the India Office of the 16th September last with reference to the proposals for the re-opening of the mints to silver; "We "would, nevertheless, strongly deprecate any steps of "the kind being taken without the fullest preliminary "consideration on the part of the banking and "commercial bodies in this country."

14. I am doubtful if any change of our currency system could safely be made until we had a coinage of our own, the extent of which would be a subject of exact knowledge, and I should prefer to see this effected before any further steps were taken. There seems to be no reason why it should not be effected gradually, and without cost to the community.

15. It may seem to be somewhat ungracious to subject the scheme set forth by the Sub-Committee to what is apparently nothing but adverse criticism, but, as it has been put forward as a basis on which to build, it is necessary to examine the solidity of its foundations. It may be urged that, if the Government is dissatisfied with it, it is bound to propose a better scheme, but I do not think that this necessarily follows, nor do I think that a scheme for this individual colony which would be workable and free from serious objections and dangers is at present practicable.

16. With two great financial experiments going on in India and Japan the result of neither of which is yet known, I should hesitate to select the present as the time for making any sweeping change in our currency system. I shall, however, welcome any proposals for obtaining the fullest and most reliable advice and information on the subject in whatever manner it might appear best to Her Majesty's Government, whether by merely local inquiry, or by an inquiry which would embrace a larger field than the unit of this colony and its individual interests. Any reasonable cost or share of the cost this Government would be quite prepared to pay.

17. The printed papers on the subject show what a divergence of opinion exists among that portion of the mercantile community here who have considered the question, but as was pointed out in the speech of one of the members of the Chamber of Commerce (Mr. Earle, page 23 of proceedings), there are many different interests unrepresented, and that the opinion of the bulk of the native trading population as to a change in our currency system, and the extent to which their interests would be affected by such a change has never been ascertained.

18. One thing only appears to be certain, and that is that there is a general wish for fixity of exchange, apart altogether from the question of how far our prosperity has been affected by the fall in the price of silver, and any assistance that Her Majesty's Government could give to attain such an end would be gratefully acknowledged by the community of the Straits Settlements.

I have, &c.,
C. B. H. MITCHELL,

The Right Honourable,
Joseph Chamberlain, M.P.,
&c., &c., &c.,
Colonial Office.

Enclosure to above despatch of 9th March 1898.

Chamber of Commerce, Singapore,
SIR, 4th February 1898.

I HAVE the honour to inform you that a special general meeting of the Chamber was held on 13th ultimo to consider the subject of Straits Currency—33 members being present out of a total membership of 47.

2. The following resolutions were then passed by a majority—17 voting in favour of, and 14 against, each resolution:—

I. "That, in the opinion of this Chamber, fixity of exchange with gold countries, on the basis of 2*s*. per dollar, is desirable in the general interests of the Colony."

II. "That Government be requested to take such steps as may be found necessary for obtaining fixity of exchange with gold countries, and that the report of the sub-committee, dated 6th November 1897, and the scheme suggested therein, together with such criticism as may be furnished to the committee, be submitted to Government for consideration."

3. I have the honour accordingly now to transmit these resolutions for the consideration of Government, and accompanying these I also forward herewith:—

(*a*) Report dated 6th November 1897 of sub-committee appointed by the committee of this Chamber "to enquire into the local Currency with the view of calling attention of Government to the question of converting the Straits Currency to a gold standard."

(*b*) Criticisms on this Sub-Committee's report by six members of the Chamber of Commerce.

4. A shorthand report of the proceedings of the general meeting of the Chamber, which dealt with this matter, is also sent with this letter, and from this it will be seen that, as an amendment to the first resolution, it was moved:—

"That, in the opinion of this Chamber, an enquiry as to the desirability and feasibility of securing fixity of exchange should be undertaken in the interests of the Colony, and that, in order to secure a thorough examination of the matter, the Government should be requested to secure expert assistance and to vote a sufficient sum to defray the cost of the enquiry."

This amendment was negatived by 17 to 14.

5. For the information of the Government the names of the firms, being members of the Chamber, who voted in favour of the resolution and also of those who voted in favour of the amendment are appended, and it will be observed that the real difference of opinion between the two sections of the Chamber was, that whilst the former were decided in their views that fixity of value should be at 2*s*. to the dollar, the latter, although apparently dissatisfied with the unreliability of the existing currency, desired an expert examination of the matter before expressing a decided opinion as to the remedy.

6. It will be noticed that in the criticisms forwarded to the Committee there is a general feeling in favour of fixity of value of some kind, although Mr. Meyeran, acknowledged representative of merchants trading with India, still desires the adoption by this Colony of the Indian Currency, but considers the present an inopportune moment for fixing the gold standard value of the dollar as thereby cutting off the chance of the Colony deriving any advantage should the price of silver recover.

7. In putting forward the scheme in the report of the Sub-Committee for fixing the currency of the Colony on a gold standard the committee of this chamber desire it to be understood that they are fully aware of the many difficulties and inconveniences which must naturally arise in the change of the currency from a silver to a gold basis; and in now submitting to Government the resolutions which are given cover to by this letter I am directed to add that the scheme or proposal for conversion, as set forth in the Sub-Committee's report of 6th November, is put forward, not in the opinion that it is perfect or complete, but more as a proposal on which Government may start investigation, and as a basis from which some scheme, calculated to operate to general advantage, may be worked out by Government and its advisers or experts upon finance.

8. In connection with the scheme which is attached to the Sub-Committee's report of 6th November I am directed to add that, although no reference is made to the point in that report, the committee of this chamber has not lost sight of the fact that, in event of a gold standard being introduced to the Straits, the question of the extent to which the new silver dollar shall be legal tender, will have to be considered.

9. The committee of the Singapore Chamber of Commerce in forwarding the views expressed by a majority of members at the general meeting above referred to, feel sure that Government will recognise that the question is of such vital importance to the welfare and prosperity of the Colony, that it necessarily demands prompt attention and exhaustive investigation with a view to some settlement. To this end the whole membership of the Chamber of Commerce appears unanimous, and I am therefore directed to express the hope that Government will, at an early date, set matters in motion, so that this gravely important question may be most carefully and exhaustively examined and considered, and some course devised by which to overcome the disadvantages and danger which under existing conditions are manifest.

I have, &c.,
(Signed) ALEX. J. GUNN,
Secretary.

The Honourable
The Acting Colonial Secretary,
Straits Settlements.

AUSTRIA-HUNGARY.

No. 55.

MEMORANDUM on the CURRENCY of AUSTRIA-HUNGARY.

(Received through the Foreign Office.)

In the year 1879 a decree was issued by the Government of Austria and Hungary whereby the free coinage of silver for private account was entirely prohibited. The result of this prohibition was an increased demand among the inhabitants of the Monarchy for the paper currency then in circulation; the reason for this preference being that the paper notes, while possessing exactly the same purchasing power as the weighty silver pieces, offered greater facilities to the public as regarded portability and for ordinary business purposes.

Thus, from the year 1879 until 1892, when the law for the introduction of the gold standard was passed, the currency of Austria-Hungary practically possessed what may perhaps most aptly be termed an "artificial" value, inasmuch as its circulation among the inhabitants was based on the confidence reposed in the Austrian and Hungarian Government that the prohibition of free coinage of silver would not be withdrawn, and that neither of the two governments would undertake the coinage of silver money in larger quantities than was absolutely necessary to back the notes in circulation among the community.

The above-mentioned decree of 1879, while prohibiting the free coinage of silver for private account, likewise imposed certain restrictions relative to the coinage of silver for government account. Thus it was prescribed that only the silver derived from the State mines in Austria and Hungary, together with such broken metal as was purchased in bulk by the State mines themselves, should be coined.

Despite these restrictions, however, the amounts coined were considerable. From the beginning of 1880 until October 21, 1892 in Austria, and August 24, 1892 in Hungary, on which dates the respective State mines suspended operations in consequence of the law for the adoption of a gold standard, the silver struck for government account reached a total of:—

£.	
5,769,076	in Austria.
3,678,618	,, Hungary.
9,447,694	

If the amount coined during the period of 1879 prior to the prohibition of free coinage likewise be added, the following figures result:—

£.	
8,984,694	in Austria.
5,824,945	,, Hungary.
14,809,639	

and, in considering this total, it must be remembered that a certain proportion also falls to government account.

It should likewise be borne in mind that only a comparatively small sum was put in circulation, the greater part serving as a reserve to cover the notes of small denomination issued for the convenience of the public.

In 1892, the law for the adoption of a gold standard was passed by the Reichsrath in Vienna and the Parliament at Budapest. Briefly put this law empowered the government of both halves of the Monarchy to gradually substitute for the florin currency then in circulation a gold crown currency. At the same time it was expressly stipulated that, until the completion of the reforms, the florin currency should maintain in every respect its former position as legal tender and should be interchangeable at the rate of two to one, that is to say, one florin in silver or paper for two silver crowns. The relation between the old silver currency and the new gold currency was fixed at $18\frac{2}{5}$ to 1.

For the purpose of carrying out the reforms embodied in the Bill, the services of the Austro-Hungarian Bank were called into requisition. This institution is the only bank in the Monarchy which is authorised to issue notes. It is in reality a private limited liability concern, but occupies a semi-official position. It is partially under government control, and both Austria and Hungary participate to a certain extent in its annual profits.

The original and supplementary Bills for the reform of the currency authorised the following financial operations, viz.:—

(*a.*) The issue of subsidiary silver, nickel, and bronze coin of the new crown currency to a total extent of 286,000,000 crowns, or about 12,000,000*l.* sterling; against which a similar amount of the subsidiary coin and small State notes of the old florin currency was to be withdrawn.

(*b.*) The withdrawal of the State notes then in circulation, amounting to about 312,000,000 florins, which were to be replaced by gold, silver, and nickel coin of the new crown currency.

(*c.*) The prescription that the Austro-Hungarian Bank should accept in exchange for its notes current gold coins at their face value and gold bullion at the rate fixed by law in connexion with the crown currency.

In due course, the Austro-Hungarian Bank commenced operations by extensive purchases of gold coin and bullion on the domestic and foreign markets, whilst the government authorities in both halves of the monarchy proceeded to obtain the necessary supply of that metal by the issue of a series of State Rentes. These operations, however, were not carried out without frequent interruptions occasioned by the recurrence of an agio or premium on gold, rendering the import or purchase of that metal unfeasible.

To explain this condition of affairs, it is stated that the conversion of various categories of Austro-Hungarian stock, &c., gave rise to an almost unprecedented influx of these from abroad. Moreover, the temporary excess of commercial importations over exportations, whereby the amounts owed abroad exceeded those due to this country, repeatedly created a stringency of more or less duration. Both these arguments are advanced to account for the slow progress made in the introduction of the currency reforms and the interruptions which have occurred hitherto.

The operations dealt with in clause (*a*) have already been completed; that is to say, the minor coin of the florin currency has gradually been withdrawn, and has been replaced by the subsidiary coins of the crown currency, the silver one-florin piece meanwhile remaining in circulation and being, as already mentioned, interchangeable at the rate of two crowns to one florin.

With regard to clause (*b*), State notes to the extent of some 200,000,000 florins have been withdrawn, and in their stead 80,000,000 florins in silver, and 120,000,000 florins in bank notes have been issued. There now remains a balance of 112,000,000 florins in State notes in circulation, which it is intended to gradually replace by 32,000,000 florins in silver, and 80,000,000 florins in bank notes.

As matters now stand, the Austro-Hungarian Bank, which, as stated above, is the only financial institution in the Monarchy empowered to issue notes, is not legally bound to redeem its notes with gold, and, therefore, would be acting within its rights were it to refuse to part with that metal whether for exportation or other purpose. Nevertheless, it is realised that a refusal would, under certain conditions, cause either an undue advance or agio in the price of gold and gold bills of exchange on the domestic market, or a depreciation in the value of the notes issued by the bank itself.

In order to prevent this, and, so far as possible, to maintain the legal par value of the Austro-Hungarian currency (according to which a florin is equal to 1*s.* 8*d.* in English money), the bank voluntarily sells gold either in the form of bullion, foreign coin, or gold bills of exchange at rates which are fixed from time to time. In fixing these rates the bank is guided by the fluctuations of the international money markets, and by its own private reports; but, in addition, special attention is given to the maintenance of the par value of the Austro-Hungarian currency.

On the whole this method has worked successfully; for, during the past three years, with the exception of some few unimportant variations, the par value has been fairly well maintained. It may also be remarked here that, in order to encourage the importation of gold and reduce the cost of transport to a minimum, the bank has arranged that gold can be sent or offered for sale not only to its central offices in Vienna and Budapest, but likewise to those of its branches situated in proximity to the frontiers of the Monarchy.

Up to the present no gold has been put into circulation in Austria-Hungary, nor is it definitely known when it will prove feasible to do so.

As soon as circumstances permit, it is primarily intended to issue that amount of gold which already has been, or has still to be, deposited with the Austro-Hungarian Bank by the governments of both halves of the Monarchy in connexion with the withdrawal of the State notes and the issue of bank notes in their stead. The authorities, therefore, propose in the first instance to put into circulation the total sum of 200,000,000 florins in gold coin, in order to make room for which it is intended to call in all bank notes of less than 25 florins denomination.

The 200,000,000 florins' worth of gold referred to above is in possession of the Monarchy, that is to say, 80,000,000 florins is now in the hands of the Treasury Department, and 120,000,000 florins in the cellars of the bank. In addition to this amount, the bank at present has in its possession the sum of about 260,000,000 florins in gold, so that the value of the gold at the disposal of the Monarchy reaches an actual total of, say, 460,000,000 florins, apart from the not insignificant quantity owned by the Treasury, and which is not destined to be devoted to the regulation of the currency. As stated in the foregoing paragraph, it is first proposed to put into circulation 200,000,000 florins in gold coin, whilst the balance of that metal in possession of the authorities is destined to form a reserve for the bank.

In mercantile circles, apprehension is felt as to the ability of the Government to retain the gold in the country when once it is placed in circulation. Contrary to Great Britain, the value of the exportations from the Dual Monarchy to foreign countries almost invariably exceeds that of the importations, so that, so far as trade and commerce are concerned, the assets due to Austria-Hungary from abroad are in excess of her outstanding liabilities. On the other hand, however, while the investment of Great Britain in foreign securities, enterprises, &c., represents an immense total, Austria-Hungary is indebted to foreign countries. Indeed, according to most recent statistics, it is estimated that the amount paid by Austria-Hungary as interest to bond, stock, and shareholders, &c. abroad, reaches a total of between 125,000,000 to 130,000,000 florins per annum.

It is, therefore, argued that should the excess of exportations over importations in future years prove inadequate to cover the amount of interest payable by Austria-Hungary abroad, and, at the same time, a disinclination be manifested by foreign countries to absorb further quantities of Austro-Hungarian securities, the differences due from the Dual Monarchy to foreign debtors would have to be liquidated in gold, and would thus cause an efflux of that metal.

These apprehensions would appear to be justified by the fact that more than once of late years the annual trade balance of the Monarchy has shown only a comparatively insignificant excess of assets over liabilities, and also by the circumstance that both in 1897 and 1898 considerable quantities of gold left the country.

Moreover, it is feared that, under certain conditions, even a favourable trade balance would not prevent an efflux of gold, similar to that which occurred in 1893, when the conversion of various Austro-Hungarian stocks, &c., brought about a sudden return of these categories from abroad, and a proportionate outpour of gold from the Monarchy.

The gradual accumulation of a large stock of gold within the boundaries of the Monarchy, the granting of comparatively high rates of interest on Austro-Hungarian stocks, &c., far-reaching support of the export trade, and, finally, the slow but steady increase of wealth among the inhabitants themselves, whereby the re-purchase of those stocks, bonds, &c., held abroad would be rendered possible, are regarded by financial authorities in this country as the surest, and virtually the only, means whereby the unpropitious state of affairs likely to be produced by an efflux of gold could be prevented.

No. 56.

Report on the Depreciation of the Currency in Brazil, showing the effect on Prices and Wages.

Received through the Foreign Office.

Nominally Brazil is still a gold standard country, the legal value of an octave* of gold being 4 milreis, the gold coins of 5 octaves (276·840 grains) and 2½ octaves (138·420 grains) having a legal value of 20 milreis (=45*s.*), and 10 milreis (22*s.* 6*d.*) respectively, while silver in the ratio to gold of 15·15 to 1 is only a legal tender up to 20$000.

		Sterling Value.
The silver coins are:		
2 milreis	25·5 grammes†	4*s.* 6*d.*
1 milreis	12·75 ,,	2*s.* 3*d.*
500 reis	6·375 ,,	1*s.* 1½*d.*
The nickel coins are:		
Two hundred reis	15 grammes	5⅝*d.*
One hundred reis	10 ,,	2¾*d.*

The copper coins, which at present low exchange must be issued at a loss, are:

40 reis	12½ grammes	1½*d.*
20 reis	7 ,,	½*d.*

The legal value of a sovereign is 8$890.

Though the nickel coins have not reached the point at which their intrinsic value is superior to their nominal value, they disappear very rapidly from circulation, except in the capital and its immediate neighbourhood; the explanation being that they are hoarded, particularly by the foreign colonists, perhaps because they are less perishable than paper. This has created a serious scarcity of small change in the provinces, and the State Governments, not being authorised to issue any form of currency, permit the circulation of *apolices* (or bonds) of infinitesimal value, some of them bearing interest, tramway tickets &c., to take the place of nickel. To remedy this evil the Federal Government has been authorised to issue nickel coins—

Of 12 grammes with a nominal value of 400 reis.
Of 8 ,, ,, ,, 200 ,,
Of 5 ,, ,, ,, 100 ,,

But although Brazil is nominally a gold standard country, it is only in the event of exchange rising to, and remaining at or above, par that the notes even of the Banks of Issue which at various times have had the privilege were in fact convertible into gold, while the Treasury paper money since 1833 has never been convertible.

The following are the periods during which one or more banks had the privilege of issue, generally in the proportion of two to one against gold and to an equal value against bonds:—

1808—1829.—Exclusive privilege of Banco Brazil, no limit. Inconvertible between 1821 and 1829.

1853—1857.—The (3rd) Banco do Brazil up to twice the value of "available funds," *i.e.*, cash in hand or gold.

1857—1866.—Six banks up to the amount of subscribed capital.

1889—1893.—Various banks all over Brazil up to twice the amount of subscribed capital.

1893—1896.—Exclusive privilege of Banco da Republica do Brazil.

The privilege has been frequently abused by the banks, sometimes no doubt with the connivance of the Government, as between 1820 and 1827, when the Banco do Brazil increased its circulation from 8,566:450 milreis to 21,574:920 milreis being nearly six times its subscribed capital of 3,000:000$. During this period the milreis depreciated from 54*d.* to 32*d.*, reaching 20*d.* before the final liquidation of the bank in March 1829.

The Government have, on two occasions, changed the par value of the milreis:—By the law of 8th October 1833, which declared the legal value of an octave of gold to be 2$500, reducing therefore the par value of the milreis from 67½*d.* (when the octave was 1$000) to 43⅕*d.*, a sovereign being declared legal tender at 5$555, and a shilling at 250 reis; and by the Law of 11th September 1846, which declared the legal value of an octave of gold to be 4$000, and fixed the par value of the milreis at 27*d.*, which has continued up to the present time.

The first of these measures failed entirely in its intended effect of increasing the stability of the currency, the reason being that no adequate and effective measures were taken for raising the paper currency to its par value. In June 1833 the rate of exchange was 38½, and already in January 1834, after temporarily rising to par, it had again fallen to 39½. Evidently no payments would be made in the precious metals when they could be made in depreciated paper.

The new Banco do Brazil was, in virtue of the Law of 8th October 1833, to substitute all the Government paper money in circulation by notes of its own, which were to have the value of 1$000, 2$000, and 5$000. Though nominally payable in gold it does not appear that these notes were in fact any more convertible than the Government paper, and the depreciation continued. the value of the milreis falling below 25 in each of the years 1842, 1843, and 1844. The bank had no privilege of issue on its own account.

By the decree of 1st June 1833 the inconvertibility of the Treasury paper money was definitely asserted, the notes of the old Banco do Brazil being substituted by Treasury notes, on which the words "payable at sight" were altered to "payable" at the National Treasury.

By the Law of 11th October 1837 special funds were set aside for the redemption of the paper money, but this law was never practically carried out, it being necessary in the following years to apply all available funds to meet a series of large deficits, and in 1839 not only were the funds assigned for the redemption of the paper money diverted from this object, but a "temporary" new issue was authorised.

Between 1833 and 1846 the currency question was constantly the subject of discussion, which resulted in the law of 11th September 1846. A lesson had been learnt by the failure of the legislation of 1833, and exchange being at the time of the passing of the law at nearly 27*d.*, the Government was authorised to withdraw from circulation sufficient paper money to raise it to this value. From 1846 to 1853 the Government paper money was reduced from 50,668:475$ to 46,684:805$, and exchange was in every year between these dates at or above par, the fluctuations varying between 1850 and 1853 from 27½ to 30½, which seems to show that the paper money in circulation was even insufficient for the needs of the country, whose foreign trade had increased from 105,823:000$ in 1845–46 to 160,976:000$ in 1852–53, revenue in the same years having risen from 26,199:179$ to 36,391:032$.

The commercial crisis of 1853 was indeed probably due to the insufficiency of the circulating medium and was easily met by the advance to the two banks then in existence—the Banco Commercial and the Banco do Brazil—of 4,000:000$ in Treasury notes.

By the Law of 5th July 1853, the Third Banco do Brazil was created by an amalgamation of the two banks mentioned above. It had the exclusive privilege of issuing notes in the capital of a minimum of 20$000 and in the provinces of 10$000 in the proportion of 2 to 1 (raised in 1855 to 3 to 1) against available funds, but under no circumstances in excess of the amount of discounts effected. In return for this privilege, the bank was to withdraw from circulation annually 2,000:000$ of the paper previously in circulation, the notes so withdrawn to be deposited at the Treasury and destroyed.

The Government was obliged to come to the assistance of the bank during the commercial crisis of 1857, by authorising an increase in its issue of notes up to four times available funds, by the suspension of gold payments, by direct advances, and by undertaking to honour its bills up to £600,000 on their London agency. In this way the crisis was met without the bank having been compelled to raise its rate of discount.

In this and the following year six new banks of issue were created, two in the Capital and four in the provinces, with right of issue, up to the amount of their realised capital, against gold, at the rate of 2 to 1, and against Government bonds, &c., to an equal value.

Alarmed, however, at the rate at which the fiduciary circulation was increasing from 62,000,000$ in 1854, to 96.000,000$ in 1859, the Government passed the Bank Reform Law of 1860, which restricted the privileges of the banks, by obliging them to reduce their issue until convertibility was assured, by compelling them to withdraw from circulation within four

* Octave =72 Brazilian grains.
=55·368 English grains.
† Gramme=15·432 grains.

months all notes of lower value than 50$000 in the capital and 25$000 in the provinces, and by stricter Government fiscalisation. The fiduciary circulation was in this way reduced by 9,261,846$ between 1861 and 1862, and exchange again returned to par.

This law met with considerable opposition; it was declared that by limiting credit commercial enterprise must suffer. The figures of the import trade do in fact show a falling off in the next two years, but it is not certain that this is a bad sign in a country in which capital does not seek investments abroad, and where the tendency was for imports to exceed exports.

In 1864 there was another commercial crisis, brought on by the suspension of payments of five important banking firms and by a repercussion of the crisis, which some of the most important European markets of Brazilian products were passing through. That the crisis was not the result of scarcity of the circulating medium, as Senhor Cavalcanti in his work on "O Meio Circulante," endeavours to persuade his readers, seems to be shown by the fact that the paper currency, far from being unduly appreciated, fluctuated between the normal extremes of 22½ and 27½.

The Government was again obliged to authorise the suspension of gold payments and to permit the Bank of Brazil (13th September) to issue new notes up to treble its available funds. Whether the additional issues thus authorised, amounting to more than 11,000,000$ between 1865 and 1866, or the outbreak of the Paraguayan war, are responsible for the fall in exchange which followed (from 27*d.* to 22*d.*) is doubtful; but it is at least probable that both causes contributed to the result. It is a significant fact that between December 1863 and December 1864 the issues of the Bank of Brazil increased from 27,297,930$ to 43,168 : 000$.

It has been seen that the wise checks imposed by Government between 1853 and 1866 prevented more than a moderate inflation of the fiduciary circulation. The same may be said of the period between 1866 and 1889 when the treasury were responsible for the issue of paper money on the extinction of the privilege of the Banco do Brazil by the Law* of 12th September 1866.

Between these years the Treasury paper increased from 42,560,444$ to 188,869 : 263$, and bank notes were reduced from 74,600 : 215$ to 16,419,000$, making the total increase only 43 per cent. while revenue between the same years had increased from 64,776 : 843$ to 145,896,141$, or 56 per cent. On two occasions, however, exchange fell below 20*d.* between 1866 and and 1869, which may be accounted for by the Paraguayan war, and again in 1885. A possible explanation of a tendency to fall during the greater part of this period is, that during the whole time, possibly ever since 1853, there was in reality an excess of paper circulation. The Minister of Finance in 1884 expresses this opinion in his annual report, though the amount was less in that year than in any since 1879, and this is rather borne out by the rise in 1889 to par, when, by the emancipation of slaves in 1888, the use for currency was suddenly largely increased.

The year 1889 was, in fact, one of the most prosperous in the history of the country. Foreign trade had reached the unprecedented figure of £59,000,000, of which more than £34,000,000 was for exports. Exchange was at par, and revenue exceeded that of any previous year, as, it must be added, did expenditure also, the happy precedent of 1888, when there was a surplus of more than £2,000,000, having been quickly abandoned.

By the Decree of 24th November 1888, the Government of the Empire gave up its exclusive privilege by allowing limited liability companies to issue convertible paper under certain restrictions and by the Law of 5th January 1889, regulations for organising banks of issue were provided, issues however being limited to 100,000,000$ in the Capital, and 16,000 : 000$ in the provinces.

In November 1889 came the Revolution which drove the Emperor from the throne.

The first Ministers of Finance of the Republic have much to answer for. It seems for a while to have been imagined that wealth could be created by the mere operation of the engraver's plate. It was a misfortune for the country that the first Minister of Finance should have been a man so remarkably gifted and so eloquent as Senhor Ruy Barbosa. There was no financial heresy but "reasoned with his gracious voice, obscured the show of evil."

He declared on 5th December 1890 (p. 4042 *Decretor do Governo Provisario*): "We are proceeding with extreme, "even exaggerated, parsimony in fixing the total "circulation of bank notes at 486,000,000$ "(54,675,000*l.*)" The figure 1,580,000,000$ (more than 177,000,000*l.*) he seemed to regard not with dismay, but as a more reasonable limit.

The following list shows the amount up to which various banks were authorised to issue during 1890 against a deposit of gold, at the rate of 2 to 1, and bonds to an equal amount:—

	Milreis.	£
Four banks for the states of S. Paulo and Goyaz	200,000,000	22,500,000
Banks in the Northern states, divided into three districts (each 20,000,000 milreis) -	60,000,000	6,750,000
Banco dos Estados Unidos do Brazil - -	100,000,000	11,250,000
Banco do Brazil -	50,000,000	5,625,000
Banco Nacional - -	50,000,000	5,628,000
Banco de Pernambuco, an additional - -	10,000,000	1,125,000
Banco do Credito Popular	40,000,000	4,500,000

by decrees dated 7th March, 8th March, 29th August, 25th September, and 14th November.

The above list does not include the amounts up to which the Banco do Brazil and the Banco Nacional might issue against the deposit of bonds.

The decree of 7th December 1890 authorised the amalgamation of the Banco dos Estados Unidos do Brazil with the Banco Nacional, the new bank being known as the Banco da Republica dos Estados Unidos do Brazil, and having the right of issue up to three times its capital of 200,000,000$ against a deposit of a third in gold, the bank to replace the Government paper money by its notes.

The privileges thus recklessly accorded would not have been so dangerous if the gold against which the notes were issued was effectively deposited at the Treasury, but as a matter of fact (Relatorio of the Minister of Finance for 1892, p. 26) nearly 2,600,000*l.* which should have been deposited never entered the Treasury.

The notes actually issued amounted to*340,714,370$ (38,330,366*l.*) being 261,252,870$ against gold, and 79,461,500$ against bonds, the preference for issue against gold being naturally explained by the advantageous rate of 2 to 1. Of this amount only 25,370,040$ had up to 31st December 1897 been withdrawn.

By the Law of 23rd September 1893, which recognised the danger of an almost unlimited number of banks of issue, the privilege was restricted to the new Banco da Republica do Brazil, which is an amalgamation of the Banco da Republica dos Estados Unidos do Brazil and the Banco do Brazil. But even in this law means were found to eventually further increase the paper circulation by the authorisation to issue 100,000,000$ (11,250,000*l.*) in *bonus* or cedulas, bearing interest at the rate of 4 per cent., nominally in aid of industrial enterprises, but merely used as an instrument of credit and very soon a depreciated instrument of credit. 80,000,000$ of these cedulas were issued, but, in consequence of their depreciation, and as they served no useful purpose, the Treasury decided to take them up and issue paper money in their place, the interest paid by the bank being applied to redemption.

Besides paper money in substitution of these cedulas, amounting actually to 79,979,600$ the Treasury, in virtue of a decree, No 1616 A of 23rd December 1893, apparently not published in the Statute Book, under the Government of Marshal Floriano Peixato, issued a sum of 83,000,000$ (9,337,500*l.* at par) in paper money between the 24th December 1893 and the 17th August 1894.

By the Law of 9th December 1896, the Treasury again assumed the sole right of issue, guaranteeing the notes in circulation, and taking over the deposits against which they were issued. Since 1894 excessive issues have been avoided, but the mischief was done, and the steps hitherto taken to remedy this rapid and enormous inflation of the circulating medium have been inadequate, while the situation has been

* Provisions were made in this law for the repayment of $11,000,000 which represented the amount of Treasury paper money withdrawn by the bank, and for gradually withdrawing the notes of the bank from circulation.

* The deposits at the Treasury in guarantee amounted to—
Gold, 93,369 : 728$.
Bonds, 79,461 : 500$.

aggravated by the low price of the chief article of export.

The above facts appear to show that the present depreciation of the currency is in a very great measure due to excessive issues.

On the whole, paper money—even inconvertible—is probably the most convenient form of circulation in a country like Brazil, of vast extent and difficult means of communication, as long as the amount corresponds with te nathional wealth, reckoned in no matter what commodity, gold only being a more convenient measure than any other, because less subject to fluctuations in value.

It has, indeed, often been stated that there is a scarcity of the circulating medium in some parts of the country, and this may be true; the cause, however, being not an insufficiency of paper money, but that the production in those places is insufficient to meet the wants of the inhabitants. If production is on a large enough scale, it is certain that the circulating medium* will be attracted wherever it is wanted—in metal, if notes are scarce, which the Government will at once know by the par of exchange having been reached. Till then the remedy should have been not to increase the circulating medium, but by all possible means to increase the national production.

The case of a country whose currency has an intrinsic value is, of course, different, but some of the remedies (such as closing the mints) are similar.

In annex A will be found a table showing the amount of paper money in circulation since 1841 for a population numbering about 14 millions in 1890.

Besides various paper crises, Brazil has also passed through what may be described as a "copper" crisis between 1827 and 1833, and a "silver" crisis between 1846 and 1849.

The circulation of copper coin, which before 1833 was a legal tender up to an unlimited amount, had increased to an enormous extent, it being calculated that in 1830 it amounted to 21,000,000$, being, at the par of 67½*d.*, nearly six million sterling. The Government, on account of the large profits made by striking coins, which circulated at the legal rate of 12$\frac{5}{10}$ to 1 as compared with silver, the intrinsic value of the metal being in the ratio of 40 to 1, had been making reckless issues, while numbers of false coins, estimated at 5,000,000$ in 1830, had also found their way into circulation. As a consequence, copper had depreciated almost to the same extent as paper, and the depreciation seemed only likely to cease when the intrinsic value of the metal was reached.

By the Law of 3rd October 1833 the Government decided to exchange all the copper coins in circulation against cedulas having a value from 10$000 to 100$000, the metal being received at 1$280 a lb., and copper was made a legal tender only up to one milreis. The issue of these cedulas, the first Government paper money, caused a great scarcity of small change, and a part of the copper money so changed had to be reissued, but the limitation of the amount to be accepted as legal tender effectually stopped its depreciation, and since 1833 there has been no recurrence of a similar difficulty.

By the Law of 11th September 1846 the ratio of gold to silver was fixed at 1 to 15⅝, slightly undervaluing silver, notwithstanding the seigniorage charged for coining, and exchange being at or above par, the country was flooded with silver coins. The crisis was ended by the Decree of 28th July 1849, which altered the relations of the two metals to 1 to 15·15, while silver was made legal tender only up to 20 milreis.

In addition to the disastrous monetary legislation from which Brazil has recently suffered, the evil has been made worse by a persistent extravagance which would have wrecked a nation less favoured by nature and of less productive and recuperative energy. Since 1837, only on seven occasions has the Government been in possession of a surplus at the end of the financial year. These red letter years are:—

	Exchange.
1845–46	25½–28¼
1846–47	27¼–28
1852–53	27½–29¼
1856–57	23½–26
1872–73	25¼–27
1888	22⅜–26⅝
1891	10¾–21⅝

With the exception of 1891 all years of high exchange.

* Exception being made in the case of subsidiary coins or symbols.

While the monetary policy of the Government continued sound, and it enjoyed credit abroad, deficits were of less importance, but, when these conditions changed, the country found itself face to face with bankruptcy. By the funding scheme of 1898, which provides for a suspension of gold payments for three years, an opportunity for reform has been given, but the situation is still critical, and can only be saved by economy and sacrifice. Fortunately, the present Government show signs that they are not afraid to face the unpopularity which reforms involve.

A good deal has been said and written in this country on the part which the balance of trade plays in depreciating or appreciating the currency.

It seems, however, to be inevitable that in the course of time exports and imports must nearly balance (as regards an excess of imports at least), since it is impossible for a country, any more than an individual, to continue for an indefinite period to spend more than it produces; nor is it easy from the figures appended to this report, showing the official value of the imports and exports for a long period, to discover any connection between their value and the rise and fall in exchange. For example:—

In 1852–53 imports exceeded exports by 13,688,000$ and exchange fluctuated between 28¼ and 30¼.

In 1854–55 there was a balance in favour of Brazil of 5,528,000$ and yet exchange was rather lower, fluctuating between 27½ and 29¼.

In 1888 there was a balance of 48,406,000$ against the country, yet exchange rose to 24½*d.*, and in 1890, with a balance of 57,722,000$ in favour of Brazil, exchange fell from par to 20⅝*d.*

In Brazil, where there is little or no native capital invested abroad, the balance between imports and exports, if one could be sure of the accuracy of the figures, is a more reliable test of the national wealth than in more developed countries, where foreign investments are necessarily excluded from such calculations.

In Annex C. are tables showing the variations of currency prices during periods of falling and rising exchange. Previous to 1867 these figures are taken from Senhor Cavalcanti's work* "On the Circulating Medium." Those for the last three periods—two of rising and one of falling exchange—between 1867 and the present time are furnished by the Jornal do Commercio, which every month publishes a list of prices of the commodities of most general consumption.

It will be seen from these lists that the tendency is for prices neither to fall nor rise in proportion to the appreciation or depreciation of the currency. The two principal articles of consumption of the lower classes—rice and black beans—seem, however, to be an exception, and since 1867 have varied almost exactly in proportion to the gold value of milreis.

Thus, between 1868 and 1875, the currency appreciated 33 per cent., while the average fall in the prices of foreign and Brazilian rice and of black beans was also 33 per cent.; between 1885 and 1889 the currency appreciated 33 per cent. and the price of rice and beans fell 36 per cent.; between 1889 and 1897 the currency depreciated 70 per cent. and rice and beans rose 74 per cent.

As is seen from Tables 1 and 2 in Annex D, giving the wages of workmen of different classes employed by two large English companies (which were furnished by their respective managers, Mr. Benert and Mr. Gunning), there has been an all-round increase in wages since 1889 of about 40 per cent.—not therefore in proportion to the depreciation of the currency—while the cost of living as regards the two first necessities has increased in proportion, and, as regards nine articles of ordinary consumption, the cost of living has increased, though not to an equal extent with the depreciation of the currency, yet more than equal to the increase in wages.

The rise in house rents has about kept pace with the average rise of prices. They have probably doubled or more than doubled since 1889.

It is therefore evident that the wage-earning classes are losers by a fall in exchange.

During the early period of rising exchange for which amounts of wages have been obtained, viz., between 1885 and 1889, there was practically no change, so that the working classes should have benefited by the rise, but, as Table 7, Annex C, shows, this is only the case as regards the first necessities, black beans and rice, the tendency of other prices being not to fall but to

* "O Meio Circulante Nacional," Rio de Janeiro 1893.

rise. In the case of jerked beef, a very important article of consumption among the lower classes, there has been a rise of 16 per cent., so that while they are losers by a falling exchange they gain little by a rising.

The prices of articles of consumption in the country which are also exported depending on various influences, do not follow the fluctuations of exchange with regularity. Thus between 1821 and 1830 when the currency depreciated 55 per cent., the prices of coffee and tobacco, instead of rising, also fell 43 per cent. and 12 per cent. respectively, while cotton only rose 7 per cent.

Between 1835 and 1844, with currency depreciating 33 per cent., coffee and tobacco fell 11 per cent. and 24 per cent. respectively.

Between 1889 and 1897 the currency prices of coffee and sugar rose less than those of any other commodity except mandioca flour, the comparatively small rise in which is explained by the largely increased production.

Similarly, during periods of rising exchange it is noticeable that the prices of commodities which are also exported do not fall in proportion to the appreciation of the currency.

Thus between 1831 and 1835 the currency appreciated 36 per cent., while the prices of four articles of export, —sugar, coffee, tobacco and cotton—only fell 6 per cent.

Between 1843 and 1847, when the currency appreciated 10 per cent., the prices of sugar and coffee, instead of falling, rose 8½ per cent. and the same phenomenon is still more striking between 1885 and 1889, when the prices of coffee and sugar rose 30 per cent. and 18 per cent., although the currency appreciated 33 per cent.; the price of coffee calculated in sterling having risen from 6*s.* 9*d.* to 14*s.* 8*d.*, and of sugar from 4*d.* to 7½*d.*

If any generalisation can be made from these figures, it is that the tendency of the chief articles of export, when no other circumstance interferes—such as an extraordinary increase in demand which has happened in the case of rubber—is to rise in price (calculated in sterling) during periods of rising exchange, and to fall in periods of falling exchange, *i.e.*, high exchange, high prices of exports; low exchange, low prices of exports.

This is natural because, as wages and general prices do not for a long time, if ever, rise in proportion to the depreciation of the currency, a low exchange cheapens production.

On the other hand, it seems that the prices of articles produced in the country and also imported depend, not so much on the cost of production in Brazil as on the cost of production in the exporting country; the best example being jerked beef which, when produced in Brazil, rises to the price of the imported article, instead of the imported article falling in proportion to the cost of production in Brazil.

Apparently, therefore, certain classes profit by a fall in exchange, viz., those engaged in the production of articles of export, provided diminished cost of production does not cause a fall of prices abroad, and those engaged in the production of articles which are also imported, such as the owners of cotton mills, of the jerked beef factories of Rio Grande, and the cultivators of maize, rice, black beans, &c., all of whom are enabled to produce cheaper, and those engaged in mining industry must be included in the same category.

Those, however, engaged in the production of the most important Brazilian export—coffee—which figures for about two-third of the total exportation, do not at present gain by a low exchange, because of the phenomenal fall in the price of this commodity, brought about by over-production, one of the causes of which may be the very fact of the cheapness of labour, &c. Nor are all those engaged in the production of commodities which are also imported gainers, as for example, those whose capital was invested when exchange was high, which now represents a depreciated value, and those who are not independent of machinery which has to be imported from abroad.

On the other hand, the losers are:

(1) All those who have fixed currency incomes.
(2) The wage-earning classes.
(3) Importers and retail dealers.
(4) The Government, and all those who have obligations to meet abroad.

Until, therefore, prices, wages, and the depreciation of the currency are again in equilibrium, which does not happen for a long time, there must always be some classes who suffer. Even when the equilibrium has been established, it is evident that creditors are still losers, as are all those bound by contracts entered into when the currency was higher.

Instability and uncertainty are still more disastrous than depreciation. Once the depreciation is established, it is probably wiser for the government to direct all its endeavour to maintain the stability rather than raise the value of the circulating medium, and this, under present conditions, can only be accomplished by the establishment of a currency convertible into gold.

ANNEX A.

Paper Money in Circulation since 1840.

(Bank Notes and Treasury Paper).

No. 57.

REPORT ON THE CURRENCY OF ITALY.
(Received through the Foreign Office.)

I.

1. The Italian monetary system is, in its normal state, identical with the French.

2. Up to 1865 the circulation was principally a metallic one. The public did not absorb bank notes, and preferred certificates and credit notes representing effective bank deposits.

The actual issue of bank notes had increased from 1860 to 1865 from an average of 80 millions of lire to an average of 132 millions.

3. The crisis of 1866, which weighed so heavily on all the money markets of Europe, had made itself felt more intensely in Italy in consequence of the rumours and preparations for war with Austria. Private individuals withdrew their deposits, and the banks which had discounted and were discounting largely Treasury "bons," restricted the discounting of bills.

Thus, large and influential financial houses, threatened with bankruptcy, pressed the Government to declare the inconvertibility of bank notes, placing the National Bank in a position to recommence discounting.

The Government, which, on its own account, was preparing to make use of the banks in order to provide for the expenses of a war with Austria, decreed the "*Corso Forzoso*"* on the 1st of May 1866, and exacted from the banks a loan of 278 millions of lire.

This decree is of the greatest importance in the history of the paper circulation in Italy; from it dates the expansion of paper issue, not only on account of the State, but also on the account of the banks themselves. It gave to the "Banca Nazionale" the privilege of inconvertibility for its notes in consideration of the loan above mentioned. The notes of the other banks were made legal tender, and these banks were granted the power of gratuitously exchanging their notes for those of the Banca Nazionale up to the amount of the sum immobilised by them as their metallic reserve.

The following account of the events which led up to the decree is taken from the "Storia della Circolazione Bancaria in Italia," by C. Supino:—

"During the period 1860–1865 the deficits in the Budgets amounted to the enormous sum of two milliards and a half of lire; and these were met mostly by foreign capital, in the shape of loans and the issue of rentes.

"The reconstituted country of Italy had launched into all the expenditure of a great nation, and the organization of armies and fleets, the construction of ports, arsenals, railways, and roads had entailed an increasing expense with which the development of the resources of the country was unable to keep pace; and the year 1866 saw a further deficit of 261 million lire for which further debt would have to be contracted.

"The credit of the State began to totter. In 1860 the price of Italian Rentes on the Paris market was 80, in 1862 it fluctuated between 67 and 75, descended to 64·40 in 1865, and finally fell to 43·90 in April 1866. The Italian Government were making every preparation for a war with Austria, and the rumours to that effect completed the work of financial discredit. The low price of Italian securities abroad induced Italian investors to withdraw their capital from the development of home industries in order to purchase their own Rentes. The prevailing opinion that Italy would take refuge in an inconvertible paper currency led foreign banks to refuse drafts on Italy, and they sent back all their Italian paper to be exchanged for metal or bills on other countries.

"Italian depositors hurried to withdraw their deposits in metal while yet in time, and the bearers of bank notes brought them in masses to be exchanged for gold.

"Gold was the one object sought, and the anxiety to obtain gold on the one side, and the dread of parting with it on the other, led to a deadlock in discounting and other financial business.

"Such was the economic situation in Italy at the beginning of 1866.

"Towards the latter end of April events precipitated themselves.

"On the 18th the Chamber of Commerce of Alessandria writes to the Minister of Agriculture praying for an immediate remedy for the hardships under which commerce was suffering, aggravated by the measures adopted by the 'Banca Nazionale' to restrict discount operations. Three days later an alarming message was sent by the Syndic of Genoa to the Minister of Finance, stating that the markets of that city were labouring under the effect of a most serious financial crisis. 'A deep and widespread mistrust is inducing 'the capitalists to withdraw their deposits from the 'banks in order to convert their paper into gold and 'export it abroad.' The Genoa Chamber of Commerce wrote again and again, 'A genuine commercial crisis 'is approaching rapidly,' and complaining that though the rate of discount was nominally low, the banks had practically suspended all discounting.

"On the 26th of April the Director General of the 'Banca Nazionale' informed the Minister of Finance that he was unable to place the Treasury 'bons,' although offered at a great loss. On the 27th the Presidents of the 'Cassa di Sconto' of Turin and of the 'Cassa Generale' of Genoa, telegraphed to the Minister with a view to obtaining large assistance from the 'Banca Nazionale,' in order to avoid the most disastrous consequences in the approaching settlement. And on the 28th April the Genoa Chamber of Commerce begged the Government to take steps to provide against the whirlwind of ruin which threatend the whole city and a great part of the kingdom.

"The Government turned to the 'Banco Nazionale' for assistance and advice. The bank set forth, in a detailed report, that circulating capital was wanting, because it had been absorbed in the acquisition of securities, or was locked up in strong rooms in consequence of the prevailing distrust; that the bank could not increase it because their notes did not remain in circulation, and therefore, in order not to have to provide for the exchange of the latter into coin, they were obliged to restrict operations; that commerce and industry consequently found themselves abandoned, or but little supported by the banking institutions; that private fortunes were shaken by the extraordinary depression in the prices of securities. 'This state of things,' concluded the Director General, 'requires 'energetic remedies, which may be efficacious to-day, 'useless to-morrow. Perhaps never was the country 'in a position so alarming.'

"Henceforth the efforts of the banks to stem the tide of panic were unavailing; the state of affairs grew daily worse, and the authorities at Genoa made desperate appeals to the Government for remedial measures. On the 30th of April the Government, having been authorised to declare war against Austria, obtained from the Chamber full powers to adopt measures for the salvation of the country, and on the 1st of May 1866 the decree was signed which freed the National Bank from the obligation to redeem its notes with metal."

In this way began the period of inflation of inconvertible paper money.

While before 1866 the total fiduciary circulation (bank notes, deposit notes, &c.) did not reach 300 millions, at the end of 1866 it was more than duplicated and has ever since been increasing.

4. The larger portion of the note circulation represented loans made to the State, which from the original 278 millions had risen in 1875 to 940 millions.

That part of the paper issued by the banks on their own account, which may be called the "commercial" circulation, had legally to be met by a metal reserve, but this was in fact far from sufficient to guarantee convertibility. But as regards the circulation of notes issued on account of the State, the banks were released from the obligation of holding any metallic reserve.

These circumstances explain the great depreciation of the fiduciary medium issued to the public to provide for the needs of the Treasury, and in excess of the real needs of the public.

The following are the statistics of the note circulation, showing the issues made to the debit of the State and those made by the banks on their own account, together with their depreciation as measured by the annual average premium on gold.

* Inconvertibility of the bank note.

Period 1866–80.

Year.	Total Note Circulation (in Millions).	Notes issued on State Account (in Millions).	Notes issued on Commercial Account (in Millions).	Average Premium on Gold.
Previous to 1866	295	—	295	—
1866	620	278	342	8
1867	849	378	471	7·37
1868	915	378	538	9·82
1869	915	378	537	3·94
1870	1,037	500	537	4·50
1871	1,206	629	577	5
1872	1,363	740	623	8·60
1873	1,464	790	664	12·44
1874	1,513	880	633	11
1875	1,561	940	621	7
1876	1,586	—	646	7·52
1877	1,568	—	628	9
1878	1,632	—	672	8·75
1879	1,672	—	732	10·17
1880	1,688	—	748	8·34

5. The succeeding period was one of many financial expedients on the part of the Government to obtain money for the State, and of a few legislative efforts in the direction of a return to a sounder currency. The latter were all abortive, and the former resulted in further concessions with regard to the note-issuing powers of the banks, and increased obligations on the part of the State with a corresponding increase in the paper circulation enforced on the people. Eventually, in spite of much resistance on the part of the banks, the abolition of the Corso Forzoso was provided for by a law introduced by the Minister Magliani, who dwelt on the evils resulting to the national production, commerce, credit, and finance from the inconvertible paper currency, and from the inflated paper issues of the banks. This law was passed on April 7, 1881. The State contracted a loan abroad of 600 millions of lire, destined for the conversion of the same value of bank notes. The other 340 millions of its debt were repaid by State notes convertible on demand of the bearer, and, since these notes were of small denomination (5–10 lire), it was calculated that the market would easily absorb them and keep them in circulation. The payment of coin for notes was, in accordance with the provisions of this law, resumed in the spring of 1883, but the public showed no great disposition to return to the practical use of the metallic currency, and the discount on paper disappeared during this period (1883–1890).

6. The operation, as a whole, was not successful. With the resumption of metallic payments there came a rush of foreign capital into Italy, attracted by the high rate of interest, and no longer fearing the oscillations of the agio. A great rise in public and private securities ensued, and the period 1881-1890 was characterised by an extraordinary activity in business and speculation, which had no solid foundation in the development of industry and commerce, but was principally manifested in banking and bourse dealings. It was also a period of great schemes of armaments, naval construction, and railroad building, which reopened in the State finances an era of deficits and public debts. Thus, while speculation was undermining the banks, the State was injuring the national credit at home and abroad.

The sum of 600 million lire, repaid by the State to the banks, while it would not have been sufficient in normal conditions to assure the convertibility of the notes already issued by the banks on their own account, was, in reality, made use of by the latter to increase, for the purpose of supporting the excessive speculation, the inflated circulation of their notes.

Between the years 1889 and 1890 the reaction began to make itself felt.

The following are the figures showing the paper circulation for the period 1881–1890.

Year.	Total Note Circulation (in Millions).	Notes issued on State Account (in Millions).	Notes issued on Commercial Account (in Millions).	Average Rate of Exchange.
1881	1,675	940	735	100·28
1882	1,672	940	732	101·26
1883	1,511	718	793	99·15
1884	1,510	611	899	100·
1885	1,441	493	948	100·35
1886	1,477	446	1,031	100·38
1887	1,470	395	1,075	100·19
1888	1,420	346	1,074	100·98
1889	1,460	344	1,116	100·67
1890	1,468	342	1,126	101·15

7. The reaction having set in with the approach of the moment of liquidation, the notes flowed into the banks, but the latter had not the means to cash them and avoided that process by many illegal expedients.

The Government and public opinion, fearing the consequences that the failure of the banks would entail on the credit of the country and on the finances of the State, supported the banks in their struggle with the note-holders demanding payment. Then began a period of an inconvertible paper currency "de facto," and the agio reappeared. Nevertheless this "de facto" paper currency did not succeed in saving the banks from failure; the State, which had encouraged the financial institution to support the speculative enterprizes of the preceding period, put an end to the uncertainty of the public by themselves assuming the liabilities of the banks, that is to say, by guaranteeing to the public the payment of the bank notes by means of State notes, taking legislative measures for declaring for the latter the "Corso Forzoso" or inconvertibility. This is the régime in force at the present day.

The following are the statistics for the period in question:—

Period 1891–98.

Year.	Total Note Circulation (in Millions).	Notes issued on State Account (in Millions).	Notes issued on Commercial Account (in Millions).	Average Premium on Gold.
1891	1,463	342	1,121	1·55
1892	1,479	341	1,138	3·55
1893	1,572	351	1,221	7·97
1894	1,610	492	1,128	11·08
1895	1,595	510	1,085	5·57
1896	1,579	510	1,069	7·63

8. In conclusion, the Government have twice declared the "Corso Forzoso" for bank notes. On the first occasion it had recourse to such a measure as a fiscal expedient in order to obtain credit and to cover the deficits in the budget; the second time there were no fiscal reasons, but the Government, having favoured the industrial fever and having urged the banks to support the building speculation, the agricultural undertakings, the "*Crédits Fonciers*," the construction of railways, &c., &c., were unable or unwilling to separate their responsibility from that of the banks; to this motive may be added the general dread of the disturbances which the failure of the great banks would have produced in the country. Therefore, in order to prop up the banks without the direct intervention of the Treasury, the "Corso Forzoso" was re-established.

II.

9. With regard to the effect of the depreciation of the paper money on commerce and on the general level of prices, it has always been the widespread opinion in Italy that the agio on gold and its rapid fluctuations have impeded import trade, and have raised, first, the

prices of imported goods, and, finally, the general level of all prices and even of wages.

But this theory does not meet with absolute confirmation by such statistics as are available, because the presence of more effective influences either hides or neutralizes the action of the depreciation of the paper money.

10. The following are the figures relating to wages, which, since 1862, have been collected at different times from a hundred of the trades distributed over various regions.

Year.	Average of Industrial Wages.	Average of Agricultural and Mining Wages.	Average of the two preceding Columns.
1862	1·36	2·44	1·90
1867	1·64	2·57	2·10
1871	1·79	3·09	2·44
1881	2·34	3·53	2·93
1888	2·55	2·64	2·59
1889	2·62	2·65	2·63
1891	2·55	2·89	2·72
1892	2·51	3·00	2·75
1893	2·53	3·48	3·00
1896	2·54	2·60	2·57

It will be seen that wages tended to rise in the period from 1862 to 1886 as well as in the period since the introduction of the "corso forzoso."*

Dividing these data respectively into the four periods:

1862–66 (no agio);
1866–80 (agio);
1880–90 (no agio);
1890–97 (agio);

which succeed each other according to a paper or metallic currency, the effect of the depreciation of the paper money is hardly distinguishable.

11. Very little or no information has been collected respecting the history of prices in Italy; official publications are grounded almost exclusively on the values of goods as fixed on the frontier by the Customs Commission, instituted in 1879. It may be said, however, that the prices of manufactures and commodities show a general tendency to go down independently of the presence or otherwise of the agio. Evidently general and particular causes of a stronger nature neutralize or disguise the action of the agio.

12. With regard to the influence of a depreciated paper currency on external trade, a correspondence is perceptible between the movement of commerce and the movement of the agio.

From the annexed tables (Table A.) it may be observed generally that the total of external trade diminishes during the transition from a period of metallic currency to a succeeding period of depreciated paper currency, and it may be noted that the difference is greater in the case of the imports than of the exports. This confirms the opinion that the existence of the agio, with its fluctuations, is an obstacle in the way of the importation of goods from abroad.

13. On the other hand, care should be taken not to exaggerate the effect which this cause may seem to have on the movement of Italian foreign trade, as there are other circumstances which may explain the variations observed. From 1862 to 1865 the Italian Government were raising loans of the ordinary kind in which foreign capital took part; hence the excess of imports over exports represents in part the advances made directly or indirectly to the Italian Treasury. *Vice versâ* from 1866 to 1880 the State drew on its credit in the disguised form of an internal issue of bank notes. Again, in and after 1881, during the years of great speculation, armaments, &c., and of new deficits in the budget, the State contracted further loans abroad; thus, foreign capital returned in great quantity into Italy and increased the figures of the import trade. The financial operation undertaken for the abolition of the "Corso Forzoso" itself acted in a similar manner.

On the other hand after 1887 the protective tariff came into operation, which led towards an absolute diminution in the total foreign trade, with a relative excess of exports over imports; its effect, therefore, is contemporaneous with that of the depreciated paper currency prevailing since 1891.

14. In conclusion, the presence of other concomitant causes makes it difficult to isolate the action of the agio on the trade of Italy, and necessitates precaution before accepting the theory of the restricting action of the agio on foreign trade.

The appended translations of extracts from Signor Supino's work, "Storia della circolazione Bancaria in Italia," may be of interest as describing the more immediate effects on the economic condition of Italy: (1) of the measure decreeing the inconvertibility of the paper currency, 1866 (Appendix 1); and (2) of the introduction of the measure re-establishing the metallic currency, 1880-81 (Appendix 2).

TABLE A.

Italian Foreign Commerce (not including goods in transit and exclusive of the precious metals).

Year.	Importation (000).	Exportation (000).	Total (000).
Period, 1862–65 (Metallic Currency).

Extract.

"Hardly had the 'Corso Forzoso' been decreed than, "as it was easy to foresee, a sensible change occurred "in the economic conditions of the country, besides a "radical transformation in the currency.

"After the decree of the 1st of May, in some regions "of Italy transactions were still carried on in metal, "nor were there districts wanting in which the distrust of paper was so great that notes were not "accepted. Sometimes the paper was accepted, but "the bargain was made in metal, and the buyer had to "pay the agio; in other places there were two prices, "one in the legal currency, the other in gold or silver.

"From this existence of a dual measure of value "arose confusion, uncertainty, and public disturbances, "greatest in the Southern provinces where the people "were least accustomed to a fiduciary circulation. "Prices underwent a change proportional to, and "sometimes in excess of, the agio on gold; but the

* Documenti a corredo del Progetto di Legge per l'abolizione del corso forzoso; Allegato No. 17, (Atti parlamentare, No. 122, prima sessione 1880.)

" rise in prices did not affect all products in the same " degree or with the same rapidity. The first to feel " the influence of the 'Corso Forzoso' were the pro- " ducts from abroad, which were paid in metal, next " the commodities which compete with foreign pro- " ducts, such as silk, wool, or cotton tissues, or those " national products which could be exported, such as " silk, flax, cheese, &c. The rise was less felt in those " goods for which the demand remained stationary, " and in certain objects of internal consumption. In " face of this increased dearness of commodities, in " hardly any part of Italy was there an increase of " wages; and, where there was such increase, it was " neither so rapid nor so uniform nor so general as " the rise in the price of commodities; in some places " wages even suffered a reduction.

"The agricultural interest was not injured by the " 'Corso Forzoso,' since many of its products were sold " abroad and the difference in exchange pocketed, while " the taxes and rents were paid in paper, as also the " debts previously contracted; the price of labour did " not rise. With regard to the manufacturing industry, " Piedmont considered the Corso Forzoso as favourable " to it, looking on the agio as a protective duty on " national production, while in other regions an entirely " contrary opinion prevailed.

"Trade, and especially the import trade, diminished " in a sufficiently sensible manner.

"On credit the 'Corso Forzoso' had deplorable effects. " Abroad, no one would do business with Italy, or " only on conditions that were ruinous to that country. " The books of the Banca Nazionale changed their " character—instead of bills of 20 or 30 thousand lire " for colonial or cotton goods, &c., they now contained " the paper of speculators on the rise or fall of the " agio and small local bills. Beyond that, the instability " of the currency, the fear of an increasing depreciation, " the uncertainty of the future, diminished all " banking transactions relating to advances, credits, " accounts current, and other similar business. Credit " was restricted, because supplies from abroad were " wanting, and because the national capital was hidden " away or sent abroad: thus it was said that one " house at Genoa had deposited £70,000 sterling in " London, and that in Umbria much private capital " was invested in the Papal States.

"But of the immediate effects of the 'Corso Forzoso' " none was more serious or more terrible than that " on the monetary circulation of the country. It is " an undisputed fact that the declaration of the incon- " vertibility of the bank note always causes the dis- " appearance of metallic money; but, while the " disappearance has usually little importance, as being " limited to coins of high denomination, in Italy, which " had shortly before joined the Latin Union, not only " the gold and silver of high denomination were ex- " ported, but also the silver and even the copper " divisionary money disappeared, because they had " currency in the other States of the Union.

"The small coins accordingly disappeared suddenly; " the Government, led by false reasoning, was un- " willing to substitute in their place small notes, as " they feared to aggravate the evil or to make it in- " curable; in the meanwhile the small transactions of " daily life became impossible, with great injury to " trade, and with danger to the public tranquility."

APPENDIX 2.

"As it was easy to foresee, the mere introduction of " the Bill for the Abolition of the 'Corso Forzoso' " brought about a sudden fall in the exchanges, the " agio, the price of Stock Exchange securities, and " produced a veritable panic in all the markets. The " anticipation alone that money would rise in value, and " would cause a universal reduction in prices, provoked " this fall long before the abolition of the 'Corso " Forzoso' was an accomplished fact.

"In view of the probable fall, the speculators " hastened to sell, intensifying the precipitous decline " in prices. Those who were obliged to sell could no " longer find buyers, while the serious business man " preferred to stop trading, looking for other means " to meet his engagements; hence an intense demand " for money just at the moment when the banks, in " order to prepare for the return to a metallic cur- " rency, were obliged to restrict their advances and " discount operations. Towards the end of November " 1880 the panic was already transformed into a genuine " crisis. The speculators for the rise were obliged to " pay heavy differences, whilst it mattered little to them " that the numerical diminution of prices was compen- " sated for by the greater value of the money in their " new purchases. Merchants saw overturned the con- " ditions on which they had based their contracts and " made their calculations. Those who had bills to meet " sustained injury by the heightened value of money, " and those who had to receive money due reaped an " unearned advantage.

"And it was not the speculators alone who felt the " influence of the forthcoming abolition of the 'Corso " Forzoso." The rapid decline of the agio, which hap- " pened immediately after the presentation of the Bill, " led to a reduction in prices, but not in those of all " goods equally or at the same time.

"Thus came about a conflict of the economic in- " terests of the various classes of society, the reverse " of that which had been manifested at the moment of " the introduction of the 'Corso Forzoso.' And as at " that time the national producers had reaped an advan- " tage from the fact that the price of the more im- " portant commodities and of labour had not increased " in proportion to the depreciated value of the paper " money; so now they suffered injury because those " same commodities and wages could not or would " not bring themselves into line with the rise in value " of the circulating medium. Moreover, the fall in " the agio immediately facilitated the importation of " goods from abroad, removed that kind of protective " duty which industry had enjoyed, and thus caused " not inconsiderable losses."

PERU.

No. 58.

Report on the Currency of Peru.

(Received through the Foreign Office.)

Whilst Peru was under the domination of Spain, gold and silver were coined in the mints, which were established at Lima, Cuzco, and Potosi. The latter place was then within the jurisdiction of the Audiencia de Charcas, in which sphere the territories forming part of the present State of Bolivia were included. Inasmuch as until the year 1776 Charcas was placed under the control of the Spanish viceroys, who resided at Lima, the mintage at Potosi has also been taken into consideration.

It is clearly shown by coinage returns that the stock of gold, as compared with that of silver, must at all times have been very small. It has not been possible to ascertain the total of the gold and silver minted at Lima, Potosi, and Cuzco since the foundation of the mints, but sufficient information has been collected to bear out the statement that silver has always been the principal currency of the country, and that consequently the disappearance of the gold currency could have no effect whatever upon wages, rent, &c., or the import or export trade of Peru.

On examination of the Returns marked I., II., III., IV., and V., appended to this Report, it will be perceived that the output of silver coin at the mints above referred to was infinitely greater than the gold minted there. It is true that gold coin was also imported into Peru from some of the other Spanish possessions, but this could scarcely have increased the ordinary stock of gold in a permanent manner, since it was constantly depleted by large remittances to Spain.

On certain occasions it did happen in Lima, and probably in other towns in this country, that silver was at a premium; but this state of things lasted for a short period only, and was probably owing to the non-arrival of silver remittances.

Gold was demonetised by statute in 1872, but, as a matter of fact, it had disappeared before that date as a circulating medium. No gold was coined between 1863 and 1898.

Though, perhaps, foreign to the scope of the inquiry, a few remarks may be made upon the history of the paper currency in Peru.

Private banks of issue were established in 1863. At first the issues were fairly well regulated. However, the Government having borrowed large sums from the banks, their situation became embarrassed, and they ran short of silver with which to redeem their notes. On that emergency the Government in 1875 relieved them from that obligation, and thus the paper became inconvertible.

During the war with Chili, which broke out in 1879, the Government continued issuing paper money, until very large sums, estimated in the aggregate at about eighty-five million soles, were put into circulation, and the notes fell to threepence per sol.

When in 1881 the Chilians occupied the Peruvian coast, they refused to receive these notes in payment of duties and taxes, insisted on being paid in silver, and opened the mint to the free coinage of silver. On the evacuation of Peru by the Chilian forces, the first Peruvian Government which was established maintained the system, and thus silver continued to be the basis of all monetary transactions. Nevertheless, paper money was still used as a subsidiary currency, but solely for satisfying domestic necessities in the provision market. However, in December 1887 the market people refused to receive it; and, notwithstanding the protests of the holders of this worthless paper, the refusal was persisted in, and since then no paper money has been issued in Peru.

A very interesting experiment is now being made by the Peruvian Government with the view of establishing a gold standard. Since 1897, measures have been adopted with that object, the coinage of silver has been suspended, with the exception of the minting of fractional coins, and the importation of soles prohibited, whilst silver coins have been melted down in large quantities and exported. The pound sterling was declared to be a legal tender, and coins denominated "libras" (pounds) of exactly the same weight and fineness as the English sovereign are being coined, but, so far, in limited quantities. Up to December 1898, 40,103 pounds had been struck.

The immediate result of these measures has been to give the Peruvian sol a market value much above its intrinsic value, inasmuch as for a long period the exchange has been at about 23⅝*d*. Gold has been imported in fairly large quantities, and it is estimated that at the present moment there are about two hundred thousand pounds in English and Peruvian gold coins in Peru.

With regard to the steps taken to procure the contraction of the silver currency, it is doubtful whether the object has been achieved. Millions of soles were known to exist abroad, especially in Central America. The incentive to contraband is so great, owing to the high rate of exchange ruling at present, that in all probability an illicit trade is carried on. In any case it is reported that silver coin has never been so abundant, even in the towns of the interior, where formerly silver had to be remitted, whilst this is not the case now. However, it seems somewhat anomalous that the stock of silver should increase without disturbing the rate of exchange.

When paper money became inconvertible, the prices of imported commodities naturally underwent great fluctuations, owing to the depreciation of the notes, and subsequently owing to the heavy fall in the value of silver. These factors have undoubtedly retarded the development of the country, and consequently affected seriously the import and export trade. But other causes more potent, especially international and civil wars, have in a much greater measure been instrumental in depressing the agriculture, trade, and industry of Peru.

4th February 1899.

RUSSIA.

No. 59.

Introduction of Gold Currency into Russia.

Memorandum by Mr. Hohler, of Her Majesty's Embassy at St. Petersburg.

(Received through Foreign Office.)

Till within the two or three years commerce in Russia and transactions of all kinds were carried on in paper money. The silver rouble was the standard monetary unit, but, except for a fugitive coin here and there, it was never seen, but its place was taken by paper money, called "credit notes." These credit notes were State notes of every requisite number of roubles, from one upwards. Unlike English bank notes, they were not destroyed on entering the bank, but were, and still are, re-issued time after time. They bore on the front an inscription that they were exchangeable on presentation *for gold or silver*, and on the back was a further inscription stating: (1) that their payment in cash was guaranteed by all the resources of the State; (2) that they were to be current throughout the Empire *on a par with silver*; and, (3) a notice against forgery. These notes have never at any time up to the present moment lost their purchasing power in the country. They date, practically, from the year 1839, the time of the famous so-called Kankrin reform—unjustly so called, as Kankrin, the Minister of Finance, was personally opposed to the change; but the Emperor Nicholas sided with the Council of State, which was in its favour. At that epoch the paper (assignazi), current together with metal, had fallen to such a point that 7 roubles, paper, were only worth 2 roubles, metal, whether gold or silver. The reform consisted in: (1) recognising the fall in the paper; and, (2) opening the exchange of paper for cash at a fixed rate of 350 roubles, paper, for 100 silver. Further supplementary measures to this were: (1) the issue of State notes to which was given currency throughout the Empire on a par with silver (Manifest of July 1, 1841); and, (2) the change of the old assignazi for the new notes (Manifest of July 1, 1843). This edict further enacted that the silver rouble of the Russian mint was re-established, as before, as the standard coin for State payments. The weight, size, &c. of this coin had been fixed by a Manifest on June 20, 1810, and is in its essential parts the same as that of to-day.

Till as late as 1869 accounts were still calculated in assignazi in the more remote parts of the country.

Before proceeding any further it would seem advisable to state here, in a tabular form, the value which these credit notes have had as a medium of exchange, in comparison with our own currency.

Rate of Exchange of the Rouble *in Pence*, with the premise that the par value of the Gold Roubie (*i.e.* Imperial=10 Roubles) is 38 Pence.

Year.	Highest.	Lowest.	Remarks.
1841	$39\frac{7}{16}$	$38\frac{1}{4}$	
1842	$38\frac{9}{16}$	$37\frac{5}{16}$	
1843	$38\frac{1}{8}$	$37\frac{3}{16}$	
1844	$38\frac{7}{16}$	$37\frac{9}{16}$	
1845	$38\frac{1}{4}$	$37\frac{7}{8}$	
1846	40	$37\frac{1}{2}$	Maximum reached in end of year.
1847	$40\frac{9}{16}$	$37\frac{1}{4}$	Fall from beginning of year.
1848	$37\frac{5}{16}$	$34\frac{1}{2}$	Lowest in April and May.
1849	$37\frac{11}{16}$	$35\frac{5}{8}$	
1850	$38\frac{1}{2}$	$37\frac{9}{16}$	
1851	$38\frac{5}{16}$	$37\frac{5}{8}$	
1852	$39\frac{7}{16}$	$37\frac{1}{2}$	
1853	$39\frac{9}{16}$	$37\frac{7}{8}$	
1854	$38\frac{7}{8}$	$33\frac{3}{4}$	Maximum was in January and minimum in April, caused no doubt by the war. More fixed at end of year between 35 and 37.
1855	$37\frac{1}{4}$	$34\frac{11}{16}$	Minimum in November.
1856	$39\frac{3}{16}$	$35\frac{5}{16}$	Minimum at beginning of year.
1857	$38\frac{7}{16}$	$34\frac{1}{4}$	Fall at end of year.
1858	37	$34\frac{7}{8}$	
1859	$36\frac{9}{16}$	32	
1860	$36\frac{1}{4}$	$35\frac{1}{16}$	
1861	$35\frac{7}{16}$	$33\frac{1}{4}$	
1862	$35\frac{1}{2}$	$33\frac{1}{4}$	Recovery towards end of year. Time of attempted payments in gold under Stieglitz.
1863	$37\frac{7}{8}$	$33\frac{1}{3}$	Sudden fall in winter.
1864	35	$29\frac{7}{8}$	Steady fall throughout the year.
1865	$32\frac{3}{16}$	$31\frac{3}{16}$	
1866	$32\frac{5}{8}$	$25\frac{3}{4}$	Sudden drop about May and June.
1867	6 June $33\frac{9}{16}$	13 April 30	
1868	2 Jan. $33\frac{1}{4}$	5 July $32\frac{1}{4}$	
1869	10 Jan. $32\frac{15}{16}$	11 July $29\frac{1}{8}$	
1870	5 June $31\frac{11}{16}$	21 July $28\frac{1}{4}$	
1871	28 Sept. $33\frac{1}{8}$	5 Jan. $30\frac{5}{8}$	
1872	3 Oct. $33\frac{1}{4}$	18 Aug. $32\frac{9}{32}$	
1873	12 Jan. $32\frac{27}{32}$	26 June 32	
1674	9 April $33\frac{11}{16}$	4 Jan. $32\frac{21}{32}$	
1875	31 Jan. $33\frac{17}{32}$	30 Dec. $31\frac{7}{32}$	Gradual fall through year.
1876	14 Sept. $31\frac{11}{16}$	23 Nov. $28\frac{5}{16}$	
1877	1 Feb. $29\frac{31}{32}$	30 Sept. $22\frac{3}{8}$	Steady fall throughout year. Slightly better at close.
1878	24 Jan. $26\frac{1}{8}$	21 April $22\frac{1}{4}$	Ditto.
1879	28 Sept. $25\frac{7}{8}$	23 Jan. $22\frac{5}{8}$	Recovery towards end of year.
1880	5 Feb. $26\frac{1}{8}$	30 Sept. $23\frac{3}{4}$	
1881	28 Aug. $26\frac{1}{4}$	5 May $24\frac{1}{4}$	
1882	4 Jan. $25\frac{1}{8}$	7 Dec. $23\frac{7}{16}$	
1883	18 Feb. $24\frac{5}{16}$	1 Nov. $23\frac{5}{16}$	
1884	28 Dec. $25\frac{13}{32}$	13 Jan. $23\frac{9}{32}$	
1885	1 Feb. $25\frac{17}{32}$	2 April 23	
1886	25 Feb. $24\frac{9}{32}$	13 Jan. $23\frac{9}{32}$	Steady inclination downwards.
1887	2 Jan. $22\frac{13}{16}$	8 Dec. $20\frac{25}{32}$	Ditto. Average price of 1 rouble, gold, in rouble credit was 1·796.

From the year 1888 onwards the rate was expressed in the number of roubles purchasable for 10*l.*:—

80 roubles for 10*l.* = 2*s.* 6*d.* per rouble.
85·71 ,, ,, = 2*s.* 4*d.* ,,
92·31 roubles for 10*l.* = 2*s.* 2*d.* per rouble
100 ,, ,, = 2*s.* ,,
125 ,, ,, = 1*s.* 7¼*d.* ,,

Year.	Highest.	Lowest.	Average Price of 1 R. Gold in R. Credit.	Remarks.
1888	23 Sept. 91·85	16 Feb. 125·25	1·682	Very great fluctuations: 115 at beginning of year, 125 in February, low until May, then rises to 92 in September; at about 96 towards end of year.
1889	29 Dec. 89·75	2 June 98·90	1·518	Steady rise.
1890	4 Sept. 76·60	1 Feb. 92	1·378	Ditto, but fall towards end of year.
1891	18 April 82·50	5 Nov. 106	1·498	Very unsteady in last half-year. General decline.
1892	16 May 94	3 Jan. 102·25	1·586	Very unsteady.
1893	29 Dec. 93·05	2 Jan. 98·85	1·532	Through most of year steady at about 95 or 96.
1894	31 Aug. 92·05	15 Feb. 94	1·492	
1895	7 Oct. 92·60	12 Dec. 94	—	May 27, State Bank fixed price of half-imperial at 7·40 and subsequently at 7·50.
1896	2 Nov. 93·15	13 April 94·35	—	
1897	19 Aug. 93·35	15 Feb. 94·05	—	

It is seen from this table that the rouble "kreditni billet," which is at par at a value of 3*s.* 2*d.*, was in the year 1847 actually worth 3*s.* 4½*d.*, and that in the process of time it has fallen to a point where it is worth only about 2*s.* 1½*d.* or 2*s.* 2*d.*, and even went as low as 1*s.* 7*d.*; *i.e.*, it has lost, approximately, on an average a third of its value; or, in other words, 5 gold roubles are worth about 7½ paper.

As already stated, these paper notes have never, from the beginning, lost their purchasing power, and have been the sole medium of exchange *within* the country. Until the last year or two *coins* were never seen, except the token coins which formed the divisional part of the rouble.

It must not, however, be thought that no coins were struck. It will be sufficient for our purpose if we examine the coinage from the year 1871 on. From that date half-imperials were struck, the standard being, like that adopted in England—11 parts of gold to 1 of alloy. They contained almost exactly 6 grammes of fine gold, their weight being 6·544 grammes (916⅔ fine). They harmonised with no existing coinage, least of all with Russian, for their face value was 5 roubles while their nominal value was 5 roubles 15 kopeks, equivalent to 20·66 francs. In the Russian market they were quoted, according to the rate of exchange, at from 6 to 9 roubles, paper. Ducats were also struck containing 3 grammes and 60 centigrammes of gold, and were nominally worth 3 roubles.

These ducats and half-imperials never entered into circulation, but were immediately hoarded in the Bank of Russia or sent off to London, Paris, or elsewhere.

The number of coins struck on this model was 55,908,054 half-imperials and 468,058 ducats, in value 1,161,227,670 francs.

In 1885 the law of 17 (29) December established a new gold rouble worth almost exactly 4 francs (4·0002), which found expression in a new half-imperial of 5 roubles. The standard was altered from $\frac{11}{12}$ to $\frac{9}{10}$ of pure gold. The new coin contained 1 zolotnik and 34·68 doli of gold (or 5·806746 grammes), and its gross weight was 1 zolotnik and 49·2 doli (or 6·45192272554 grammes). Now a louis d'or (20-franc piece) contains 5·80644 grammes of gold and its gross weight is 6·4516 grammes. So that the half imperial contains ·000306 more grammes of gold than a louis; or, in other, words it is worth intrinsically 20·001014 francs or 15*s.* 10·323*d.* or 16·20082 marks.

Imperials (of 10 roubles) were also coined at this time, while ducats were abandoned. The new half imperial being thus so nearly identical with a louis was able to, and actually did, and does still, circulate abroad in countries of the Latin Union; but in Russia, they were merely used as articles of commerce except in the case of the payment of the Customs dues. They had nothing in common either practically or legally with the silver, *i.e.*, paper, rouble which was then the monetary unit of the Empire. Gold was not even a legal tender between private persons. The number of coins struck of this currency is variously given, but the following figures are given officially for the coinage from 1887 to 1895.

Year.	Gold Coins.		Silver Coins.	
	Imperials (in Roubles).	Half Imperials (in Roubles).	Of full Weight and Value (in Roubles and Kopeks).	Small Change Tokens (in Roubles and Kopeks).
1887	9,750,020	16,305,015	510,507	1,500,002
1888	225,060	26,285,035	500,022·25	1,007,011·50
1889	3,430,020	21,000,000	1,753·50	1,493,001
1890	150,060	28,000,030	91,760	2,000,003
1891	30,100	2,705,040	1,135,024	2,351,504
1892	80,060	640,030	2,133,010·50	1,650,000·30
1893	10,080	2,990,040	1,489,014	1,750,004
1894	10,070	2,990,035	3,007	400,000
1895	50,000,380	180	4,605,053·50	199,000·60

It might here be observed in parenthesis that payments, especially in certain districts, are frequently made in stocks or in coupons; and there is also an official table published of the Russian loans of which the bonds and coupons will be accepted as gold money, and the price at which they will be accepted, in payment of Customs and other dues.

The gold money thus coined was used only for the payment of coupons of loans which had been made on a gold basis, and for the payment of foreign creditors —the balance of trade, in fact—for whom, of course, the Russian paper money would have no value. There is one other purpose for which this gold was necessary. A law came into force on January 1, 1877, when, as will be seen in the first table above, the exchange was at about 29, by which it was enacted that all Customs duties were henceforth to be paid in gold. This was equivalent to raising the duties from 30 to 50 per cent. (according to the exchange of gold) all round; the merchants, however, had due warning, and much consideration was shown at first in the execution of this law. But it introduced an additional element of uncertainty into business, *i.e.*, the varying price that would have to be paid in notes for the gold with which to acquit the Customs; further, it increased the weight of the Customs dues in proportion as the note fell in value. The measure is especially important as being the first official recognition of the depreciation of the

rouble, which recognition has developed into its final form in the recent changes introduced into the Russian currency.

Internal loans were mostly raised on a paper basis.

The table of exchanges given above would appear sufficient to prove the extreme fluctuations to which the unit of Russian currency was liable. The paper rouble had already fallen almost 50 per cent. from its origina value, owing partly to the general decline of the credit of the country, partly to the large issues (400 millions) during the Turkish war, and partly to the autocratic constitution of the country, which induced a fear of sudden changes or of events following on the death of a monarch, as well as to various other causes. But what produced far more serious consequences to the merchant were the fluctuations.

Thus, on the bourse of Berlin we find the rouble quoted at the following extremes :—

Year.	100 R. Credit equals	
	Highest.	Lowest.
	Marks.	Marks.
1891	245·10	191·50
1892	216·40	197·00
1893	217·20	203·35

The average of the exchange value of 10*l.* sterling monthly during 1893 and 1894, was as follows :—

——	1893.	1894.
January	97·00	92·84
February	94·54	93·66
March	94·81	93·37
April	95·69	93·19
May	94·92	93·30
June	94·32	93·28
July	95·70	93·08
August	96·43	92·89
September	95·57	92·71
October	95·18	92·89
November	94·82	92·28
December	93·71	92·63

The increased steadiness and appreciation of the rouble in 1894 is due to the following facts: The Russian credit money had become the favourite object of speculation on the Berlin bourse. In 1893 the then Russian Minister of Finance, Mr. Wishnegradsky, realised the intolerable condition resulting from this and took drastic measures. All the speculators in Berlin continued to sell rouble notes many times more than had ever existed in Germany, and the Russian minister proceeded to set agents to work buying them up at the rate of 216 marks and over. This continued for eight months, when Mr. Wishnegradsky suddenly imposed a check on the export of notes from Russia, which previously had gone on on an enormous scale, and at the September settling in 1894, demands were presented to the speculators for the notes they had sold. They were compelled to throw themselves on the mercy of the minister whose terms, however, did not err on the side of leniency. This species of speculation had its origin in quite a genuine, honest, financial operation, for whenever a merchant had concluded a transaction, he was forced by the variations of the rouble to go and secure a sufficient number of them to meet his engagement at the time when it fell due.

But even such a lesson as the above would not be sufficient to stop all speculation entirely, and was ineffectual for preventing the injurious effect of fluctuations of the paper rouble, due to genuine courses. Owing to the above-mentioned purchases by the Russian agents, the rouble had not sunk during 1894 below 216·80 marks per 100 roubles; and to maintain it approximately at that price recourse was had to the following measures: The Government drew bills payable in three months on their various agents in foreign countries, fixing the rate of exchange at the rate of 46·27½ roubles for 100 marks. They then announced that the State bank was prepared to sell these bills at this rate, or to buy others at the same rate, and that they were obtainable at the "Chancellerie de Crédit" (office of Ministry of Finance) in St. Petersburg, and at the offices of the bank in a certain number of towns. In this manner a limit was fixed beyond which the market value of the rouble could not fall, although the Government in selling at that price may have had, at first at all events, to sustain a loss. This process is still going on, and the "Bourse News" has every-day an announcement on the outside sheet of the rate at which the Government sells or buys bills. Exchanges have also been established in some of the chief towns in which the State bank has a branch office, in order to preserve the level all over the country as far as possible. Moreover, all the local treasuries were turned into branches of the bank for this purpose, as well as to obviate the inconvenience of the large transmission of notes through the post, as it has been estimated that 20 per cent. of the notes in circulation are permanently in the post.

This measure may be artificial and regarded by some as going beyond the ordinary limits of State interference, but it at least had the effect of making the merchant sure of his position. An advantageous transaction was no longer liable to turn to his loss by the ups and downs of the rouble previous to the term of payment, nor was the price of his imports suddenly heightened or lowered by the variation of the amount he would have to pay for the gold to meet the Customs dues.

At the end of 1895 the State had thus been selling roubles on the Berlin bourse at the rate of 100 roubles for 216 marks, and a mark is always exchangeable for ·358423 grammes of gold; consequently, one rouble paper $= \frac{\cdot 358423 \times 216}{100}$ or ·77419368 grammes of gold, and a half-imperial contains by law, 5·8068 grammes. On comparing these values it is seen that a half-imperial is equivalent to a trifle over 7½ paper roubles. As the State had been operating exchanges on this basis in Berlin for the past two years, and that without occasioning a drain of gold, there appeared no reason why they should not do the same at home, and on December 12–24 1895, the State bank published a declaration stating that "jusqu'à nouvel ordre" they would give half-imperials for paper money, and *vice versâ* at the fixed rate of 5 rouble gold for 7½ paper. Few notes were presented for change.

On August 8, 1896, an Imperial decree appeared, ordering the State bank to buy and sell (receive or give in payment) paper roubles at that price until December 31, 1897, and from that date on until further orders. This payment of the notes in gold, fixed for a period of 16 months, was the beginning of the gold currency. It was found that this also did not cause a drain of gold; on the contrary, there was no demand for the metal, and in consequence we have the series of enactments beginning with that of January 3, 1897.

The acceptance of the gold in lieu of paper was not altogether a voluntary thing, nor is it to-day. Although the Government say that they give either gold or notes, they thus far have to endeavour to force as much as possible the gold issue, and are making considerable efforts at the present date with this aim. I am informed that when a merchant or banker sends to the State bank for say 10,000 roubles, his porter is given half in gold, which he will spend some hours in counting, and although he might unquestionably obtain notes for his gold by going to some other department the following day, business hours are short here and the counting takes long, so that the money would not be available till the day after, and thus three days' use of the money would have been lost.

There is an absolute and strong preference throughout the country for notes, to which the people have always been accustomed, over gold coins, which most of them have never in their lives seen before. It is also very easy to understand the dislike of taking the gold coins as they existed previous to January 3, 1897. The imperial, as already stated, was marked ten roubles and the half-imperial five roubles; the task of persuading an illiterate and fairly suspicious people that these objects were of the value of notes to the amount of 15 and 7½ roubles respectively might tax the powers of an Admirable Crichton.

These were the causes which provoked the Ukase of January 3, 1897. It is addressed to the Minister of Finance, and after summing up the reasons for the changes, it decrees: (1) that without making any modification in the quantity of pure gold, nor in the name, weight, or dimensions of the gold coins as they

have already been fixed by law, he shall have struck imperials and half-imperials, bearing, as indication of their value, the former 15 roubles and the latter 7 roubles 50 kopeks, in conformity with the description therewith given; (2) that he shall put the said gold coinage into circulation.

An Imperial order of the same date states that "with regard to engagements undertaken in gold "roubles, and to the payments to the Crown of the "customs duties and other taxes leviable in gold, the "imperial and half-imperial mentioned in the above "ukase shall be accepted, the former as 10 roubles "gold each and the latter as 5 roubles gold each." A description of the coin follows.

The next enactment is dated August 29th of the same year, and provides for the arrangement, on a new basis, of the gold reserve. It states that the Ukase of January 3rd has brought the nominal value of gold to meet the value at which its exchange for notes was fixed, and has strengthened the circulation of the latter, and given both to them and to the gold circulation a firm basis. But the previous laws as to the guarantee of the issues of paper do not correspond to the conditions established by that Ukase. Consequently, "paper money is issued under a guarantee of gold, "strictly limited by the urgent needs of the monetary "circulation. Up to 600 million roubles the paper must "be guaranteed by half its value in gold, and beyond "that sum it must be guaranteed rouble for rouble."

And, finally, we have on November 14th, 1897, two more Ukases.

The first decrees the coinage of gold pieces of the value of 5 roubles, equal, therefore, to one-third of an imperial. Then follows a complete description of the coin, its weight, dimensions, &c. (These pieces are popularly called "Lilliputs.")

The second, after summing up the reforms introduced by the Ukases of January 3rd and August 29th, by which the gold coins and the paper notes have been set on an uniform basis, and the guarantee of the notes established on a firm foundation, orders that henceforth the notes shall bear the following inscriptions in place of those they at present bear: "The State bank "pays credit notes in gold coin without limitation of "amount (one rouble $= \frac{1}{15}$ of an imperial and corre- "sponds to 17·424 doli of pure gold)."

The inscription on the back to run as follows:—

"1. The exchange of State credit notes for gold coin is guaranteed by all the resources of the State.

"2. State credit notes circulate throughout the Empire on a par with gold coin."

Paragraph 3 remains unaltered.

Thus the gold rouble, corresponding to 17424 doli, or ·774 grammes of gold, has become the monetary unit instead of the silver rouble which used to correspond to 26·136 doli or 1·161 grammes of gold.

These are the legislative acts by which the change was effected. The ratio of 7·50 to 5 was fixed on the average for about the last 25 years, and on what had been the actual relation between the gold and the credit rouble for three years past, and the rouble now equals 25·37 *d.* or 10*l.* = 94·6 roubles. In 1887 the question was before the Committee of Finance in the Council of State as to whether it would be better to endeavour to get the credit rouble back to par or to fix it at its actual exchange value. The Committee decided in favour of the latter proceeding, and their decision had the Emperor's approval; but during the reign of that monarch any change was deferred, owing to his conservative spirit. The Council at the same time also decided that the increasing need for a circulating medium, due, if to no other cause, at least to the increase in the population, rendered it impossible to withdraw the notes issued during the war; otherwise, such a measure would have gone far to enhance the rouble note, and bring it nearly to its par value.

The principle embodied in the stamping of the new gold coin as "15 roubles" instead of "10 roubles" is blamed by many as being an arrangement established on a depreciated currency: they maintain that though the silver rouble was the legal monetary unit of the country, yet the silver rouble was linked to the gold imperial in the proportion of 10 roubles to an imperial, and that when the silver rouble was replaced by the credit rouble the bond was none the less maintained, more especially as the note-money bore a statement that the note was exchangeable for either gold or silver; their deduction consequently is that each holder of 15 roubles paper has unjustly been deprived of five of these roubles.

This argument is in theory quite correct. Each holder of a 5 rouble note is entitled to receive for it 5 roubles' worth—1·161—grammes of gold each—and the present law accords them only ·774 grammes, but the rouble had never, from its very beginning, been a fixed quantity, and it is only necessary to look at the above list of exchanges to assure oneself that the possessors of the notes could hardly expect to see themselves paid in gold at par. And, whereas before it was quite uncertain to what point the rouble, from natural causes, might sink, the reform has placed it on an absolutely firm, and, as far as it would appear possible, equitable basis. The present Minister of Finance states with great truth that in making the reform it has been necessary to grapple with the actual facts, and not to lose oneself in theoretical considerations.

But, granted that the reform is wrong, what course would those who oppose it suggest to adopt?

There appear to be two alternatives: either to reimburse the 10-rouble note at 10 roubles gold, or, as the Russian Government might perfectly well have done, to resume a silver currency.

The amount of gold at present held by the Russian Government is sufficient to have enabled them to adopt the first of the alternatives, although they would have been hard pressed, despite their present enormous reserve, to maintain it; but the consequences would have been positively disastrous to trade. For instance, wheat is the chief produce of Russia, and the rouble would have suddenly made such a jump as would have put that article to an almost prohibitive price, and its export would have been almost entirely stopped; and it must be remembered that just as the decline of the paper rouble in foreign exchange was accompanied by no corresponding decline in its purchasing power in the country, so the purchasing power would not now increase in proportion to the rise in exchange value, the result being that the peasant would have about 50 per cent. less money for his exported produce than formerly, and would be to that extent poorer as far as his purchases inside the country were concerned.

Also those merchants with foreign connexions who were in possession of notes would suddenly find themselves at an advantage of 50 per cent., while those who were under engagements to deliver roubles would suffer a corresponding loss;—the most elaborate enactments could hardly meet such a case.

The Minister of Finance says with entire justice in his report on the Budget for 1896 that "by the reform "no one should become richer or poorer; the re-organ- "isation ought to have no other effect than to put "every reckoning, all property, all revenue, and all "salaries on a firm and stable foundation on which all "may rest without fear of shocks or apprehension of "accidents."

Further such a measure would have done away with the well-intentioned effect of the new customs tariff, firstly, by causing all home industries to work on the basis of the new enhanced rouble note, and secondly, by putting all transactions on the gold standard on which at present only the customs dues are paid.

It is urged that the Russian Government might have waited until such time as the note had rehabilitated itself at par, which in time it might well do, especially in view of its recovery during the last few years. This is perhaps true, but the first of the above-mentioned objections would hold good, although the effect would have been spread over many years and thus be less felt. Besides, the need for some reform was urgent, and the Russian Government cannot fairly be blamed for taking what steps they found practicable at once instead of deferring their action to some indefinite future period.

Before examining the second alternative, it is necessary to know precisely what the silver rouble is. It contains 17·996 grammes of pure silver, and before 1886 its full weight was 20·73 grammes, its fineness being consequently $\frac{868}{1000}$. In 1886 the full weight was reduced to 19·99 grammes while keeping the same amount of silver, the standard was thus made $\frac{900}{1000}$ (English standard is $\frac{925}{1000}$). In 1860 silver was worth about 60 pence an ounce, whereas it is now about 30. Consequently, by comparing the value of silver, the

rate of the rouble note, and the amount of silver in the rouble, the following statistics are obtained :—

Year.	Average price of silver per ounce in pence.	Exchange on London for 10*l.* in roubles.	Average price *in Credit Notes* of weight of silver contained in 100 R. calculated on basis of the two previous columns.	Average price *in Credit Notes* of 100 R. coined silver in Petersburg market.
1860	61·69	67·15	107·96	—
1880	52·21	95·73	132·62	136·73
1881	51·83	95·28	129·12	133·44
1882	51·72	99·21	133·73	136·58
1883	50·75	101·18	133·83	137·80
1884	50·63	98·46	129·92	133·78

1892	39·58	99·07	102·20	110·82
1893	35·33	95·22	87·68	104·38
1894	28·80	93·02	69·82	—

Thus, in 1894 the amount of silver requisite for coining 100 roubles could be bought for 70 roubles credit.

If the Russian Government had been avaricious but unwise, they might have resumed a specie currency and have paid off their notes, which "circulate on a par with silver" in silver roubles; but in doing so, they would have depreciated their notes by a third of their value, lowered their credit, and so committed, in point of fact, a breach of faith, causing grave injustice and paralysing trade.

But so far from their acting thus, an Ukase was issued on January 8–20, 1893, forbidding the coinage of silver for individuals, and explaining that this was done, lest the silver should be set running concurrently with paper, and so cause a depreciation of the paper.

This limitation of the coinage of silver brings about a condition of things similar to that called the "limping system," which obtains in France and Germany.

Moreover, the wording of the new laws, as well as the inscription of the new notes, ordered by the Ukase of November 14th, 1897, does not leave to the bank even the theoretic faculty of paying the notes in silver. The silver rouble is no more the standard currency. There is, however, *no* law yet made as to the amount to which it is legal tender. When the reform was being discussed it was proposed to limit the amount to 50 roubles for any one payment. It is, however, received at par and in unlimited quantities at all public bureaux. Mr. Witte in his report on the Budget for 1898 says: "the next step in this direction will doubtless be the limiting of the coinage of silver, and of the amount for which it will be legal tender, while, of course, it will be accepted as heretofore by the Government treasuries to an unlimited amount."

The actual limited issue of silver is at present a sufficient safeguard against a double standard, as is indeed proved in the foregoing table by the price at which coined roubles were sold in the money market, but a limitation of the legal tender would help to check false coining, which appears at present to be pretty rife.

It is hoped that enough has now been said to explain the reasons that prompted the reform, the steps preparatory to its execution, the manner in which it was carried out, and the calculations on which the basis of the new currency was fixed.

In the report on the Budget for 1896 the Minister lays stress on the necessity for disregarding theories and reckoning solely with actual facts in such reforms, and says that by them no person should be made either richer or poorer, nor should any artificial modification be introduced, as the monetary system is the foundation of all calculations and of all the interests of property and labour.

If the result had been contrary to these principles, one could hardly fail to hear complaints, but no interests appear to have been injured except of those whose business it was to buy and sell gold, customs agents, &c., whose opportunities of profit have been minimised by the fixation of the rouble through the entry into the market of the Government.

The next point of interest is to see what amount of gold Russia possessed in order to enable her to carry out the reform. The following is the statement given in the Report on the Budget for 1898:—

———	Bank Notes issued. (*In new Roubles.*)	Gold in State Bank and Treasury.	Percentage of Gold to Notes.
End of 1896	1,121,300,000	1,206,000,000	107·5
End of 1897	999,000,000	1,315,000,000	131·6

The gradual increase of the amount of gold held is illustrated by the accompanying table of the notes issued and in circulation, and of the metallic resources of the Treasury and State Bank.

Year	In thousands of Credit Roubles.			In thousands of Gold Roubles.	In thousands of Credit Roubles.	In thousands of Gold Roubles.	In thousands of Credit Roubles.	In thousands of Gold Roubles.
	Total of authorised Issues.	In the State Bank.	Consequent Circulation in fact.	Total of Metallic Reserve of Bank.	Treasury Bonds.	Gold at disposal of Treasury.	Total of Debit.	Total of Credit.
1881	1,133,515	48,464	1,085,051	183,063	216,000	108,049	1,301,051	291,112

1896	1,121,300	66,100	1,055,200	—	—	—	—	—
1897	1,121,300	—	—	—	—	—	—	—
1898	999,000	69,173	—	—	—	—	—	—

The figures given vary occasionally. It is impossible to analyse accurately the means by which the gold gradually increased year by year, but the official statistics for the export and import of the precious metals are appended in conjunction—for the period from 1887 onward—with the figures given by the Imperial Mint of the output of gold from Russian mines.

Year.	In thousands of *Gold* Roubles.		
	Imports.	Exports.	Excess of Exports over Imports.
1871	6,345	16,861	10,516
1872	8,111	6,649	−1,462
1873	2,500	14,309	11,809
1874	6,552	17,054	10,502
1875	1,721	27,576	25,855
1876	1,488	101,845	100,357
1877	9,403	13,592	4,189
1878	10,249	6,806	−3,443
1879	7,388	5,322	−2,066
1880	7,046	25,876	18,830
1881	5,371	66,925	61,554
1882	4,489	68,136	63,647
1883	3,014	19,212	16,198
1884	2,412	3,034	622
1885	2,489	5,336	2,847
1886	2,401	14,293	11,892

For convenience of calculation the figures from 1887 on are given in pouds, coins being reckoned at 100 pouds = 90 pouds bar gold.

Year.	Exports.	Imports.	Excess of Exports over Imports or vice versâ.	Production of Russian Mines.	Augmentation of National Stock.
1887	1,195·7	138·6	1,057·1	1,845·7	788·6
1888	2,224·6	1,330·9	893·7	1,956·8	1,063·0
1889	1,242·6	191·4	1,051·2	2,128·6	1,077·4
1890	1,204·4	1,125·1	79·3	1,943·9	1,864·6
1891	43·9	5,149·5	−5,105·6	2,219·0	7,324·6
1892	16·5	7,431·0	−7,414·5	2,173·4	9,587·9
1893	12·2	939·5	−927·3	2,343·2	3,270·5
1894	2,672·0	7,769·9	−5,097·9	2,216·8	7,314·7
1895	14·4	1,649·2	−1,634·8	2,654·3	4,289·1
1896	15·0	6,050·2	−6,035·2	1,978·2	8,013·4
			Total		44,593·8

The figures of the output of gold vary in every list I have been able to find, and I have chosen those of the Imperial Mint as being most likely to be accurate.

It is interesting to see how that, whereas before the exports had almost uninterruptedly been in excess of the imports, in 1891 the balance swings completely round; 1891 was the year of the new customs tariff.

The last column is the result of the others, and may be termed the "increase of the national stock" as the figures represent all private transactions which would practically mean the balance of trade, and State transactions which would include exports for payments of coupons, &c., and imports derived, say, from loans; and they also include the gold output, which, as the mines are mostly private property, is not a clear gain of so much wealth to the Government. All gold produced in Russia is, on its issue from the mine, taken to one of the Government refineries, which gives a receipt for it; this receipt is, on presentation at St. Petersburg, met with a corresponding amount of money, subject to a tax varying from 3 to 15 per cent. according to the locality from which it comes.

It will be seen that since 1887 the increase of the national gold stock has reached a total of 36,580·4 pouds by 1895, which reckoning a pound at 21,150 roubles of the new stamp (or 14,104 roubles of the old) gives a total of 773,675,460 roubles.

The increase, however, of the reserve at the disposal of the treasury and the bank during the same period will be seen to have reached only 546,277,500 roubles (new). Gold was not in circulation during this time, and the State was the great holder of the metal. 225,000,000 roubles seems under the circumstances to be a large sum to have been absorbed in the country under the circumstances in so short a space as ten years.

But if we reckon in the year 1896, the same figures come respectively to 943,158,870 roubles and 933,681,000 roubles, so that the amount belonging to the treasury and the bank almost catches up the amount of the increase of the national stock. It is possible that the figures given in the case of the latter are inaccurate.

In the report on the Budget for 1897, in enumerating the steps taken to ensure the success of the reform, the first of these measures is thus described:—"Il a été conclu un emprunt 3 pour cent. or, dont le "produit, porté à 100 millions de roubles or effectifs "par un prélèvement sur la disponibilité du Trésor, est "destiné à rembourser à la Banque de Russie une "partie de la dette non productive d'intérêt du Trésor "du chef de l'émission de billets de crédit." A footnote adds that the rate of interest on this loan is lighter than that on any other Russian loan.

One of the chief sources from which the Government has been supplied with gold is the customs, which have had to be paid in that metal since 1877, but the figures here below must not be considered as clear gain of gold to the State, as the State first sold the gold to the merchant, who then returned it in payment of his customs duties.

Yield of Customs Duties in Gold Roubles.

1882	64,322,457
1883	66,640,887
1884	65,076,698
1885	64,441,686
1886	70,775,550
1887	64,170,467
1888	69,947,422
1889	80,298,459
1890	82,727,594
1891	79,567,858
1892	82,709,275
1893	97,175,007
1894	114,324,919
1895	113,088,222
1896	125,613,783

The sudden increase in the last few years is due to the new high tariff which came into force in 1891, and this has a far more important bearing than the mere increase of the dues.

The effect of the new tariff is to put a very heavy burden on imports into the country so that the quantity of imports tends to diminish, and the amount of gold previously sent out of the country in payment for the articles imported tends to diminish likewise. The tariff is thus one of the most important checks to a drainage of the gold, and it is alleged that this consideration was entertained by the Russian Government at the time when the tariff was under revision.

A result of the tariff has, as is well known, been that the rails for the Siberian Railway, for instance, are paid for to home manufacturers at a price three times exceeding that for which they might have been procured abroad. It seems that there is an extremely large and increasing demand and even a keenly-felt need in Russia for iron and machinery. At present foreign iron and steel, worked, and iron machinery pays a duty of one rouble and 40 kopecks, gold, per poud. It is apprehended that, if this were reduced, the country would be flooded with foreign machinery for which the people would of course have to pay in gold, and it is believed that this demand would assume such proportions as to threaten the parity of paper with gold, and, that once unsettled, it would be hard to say where the fall might stop. This argument is a weapon in the hands of the home manufacturers to oppose the diminution of the customs.

It seems quite possible however that the present enormous reserve could withstand such a drain until the imported machinery had had its results in the increased production of articles suitable for export.

It has been the policy of the Russian Government at the same time that they instituted the high tariff to encourage the export trade by granting various facilities such as lowering the railway rates, &c., &c., although more might with advantage have been done in this direction.

However, as a matter of fact, the above steps have been sufficient to turn, at least for the present, the balance of trade in favour of Russia.

As far as this aim had weight in the decision of the new tariff, so far the new circulation may be said to have had its share in laying on the people the high prices which they now have to pay for manufactured goods—for the prices of home industries have naturally risen just to the point where they can successfully compete with the imported article.

Mr. Witte himself says à propos of the tariff that "having entered upon a course of protection of home "industries, we ought to wait for some stable results of "this policy. Abrupt changes in the established con- "ditions of international barter would be exceedingly "pernicious and unjust: they would cause undeserved "loss to many investors in industrial undertakings, "and would draw capital away from established "branches of industry. *The interference in the com-* "*mercial and industrial operations thus caused would* "*unfavourably affect all monetary transactions, which* "*would create great difficulties in the preservation of the* "*monetary standard.*"

It is beyond the scope of this report to endeavour to ascertain precisely the sources from which the present large stock of gold was obtained.

If it was produced by the improved economic condition of the country, the circulation may be regarded as settled on a firm basis which only would be shaken by such severe shocks to commerce as a war or some other great national disaster. If, however, it is assumed that this gold, either wholly or in part, is the product of loans, then the state which, though poor, is already heavily burdened with debts, has undertaken further obligations, and has more interest to pay, for the enjoyment of a gold currency. It is possible that it may gain corresponding advantages, and that in future it may be able to issue new loans advantageously or to effect new conversions, on the strength of possessing a gold currency. The facilities for contracting engagements in gold will also, in the opinion of men of experience, tend to attract foreign capital to Russian enterprises, and these men maintain that the recent large influx of Belgian and French companies during the past year or two, is a proof of this argument. That the fixation of the rouble co-operated strongly to this end, there can be no doubt.

But, on the other hand, if this assumption is for the sake of argument admitted, then the gold stock has been raised artificially, and although with its help the Government is able to start payments in specie and to prevent the fluctuation of the rouble, and to secure the market against an adverse exchange, yet in time the payment of the coupons of the loans, which has to be effected in gold, will inevitably end by drawing from the country the gold which has been amassed with so much care and at the cost of such sacrifices.

Which of these alternatives is the case, is a question that can only be decided by those who have a thorough acquaintance with Russian finance; none can have this so well as the projectors of the reform, and they at least have shown their confidence that the advantages to be derived will outweigh any drawbacks that may be incurred.

The following are the figures showing the circulation for 1864 and 1881.

In Millions of Roubles (Gold), (Old Stamp).

	Bank Reserve.	Amount in Actual Circulation.					Population.
		Notes.	Gold.	Silver.	Fractional.	Total.	
1864 - - -	55·7	636·5	—	20 ?	30*	686·5	78,400,000
1881 - - -	171·5	1,085·0	—	20 ?	75*	1,180·0	96,200,000

The figures given in various official publications vary considerably, but the following are those given in the Report for 1898.

In Millions of Roubles (New Stamp).

	Gold.		Standard Silver.		Notes.		Total.
	In State Bank and Treasury.	In Circulation.	In State Bank and Treasury.	In Circulation.	In State Bank and Treasury.	In Circulation.	
End of 1896 - -	1,206	37·5	73	50	139·7	981·6	—
Total - -	1,243·5		123		1,121·3		2,487·8
End of 1897 - -	1,315	155	63	99	69	930	—
Total - -	1,470		162		999		2,631

Population, 125,000,000.

The notes circulating in these years were divided thus:—

Year.	100 Rouble Notes.	50 Rouble Notes.	25 Rouble Notes.	10 Rouble Notes.	5 Rouble Notes.	3 Rouble Notes.	1 Rouble Notes.	Total.
1864 - -	62·7	86·5	141·3	84·5	96·2	108·6	56·7	636·5
1881 - -	376·8	0·7	198·4	147·4	154·5	147·4	108·3	1,133·5
1896 - -	429·8	0·1	67·8	204·3	185·8	129·3	104·2	1,121·3

* Very doubtful figures.

The Ministry have stated that the small notes will be withdrawn from circulation gradually, and the present supply of silver, which amounts to 240 million roubles, will be sufficient to replace the notes of 1 and 3 roubles. It is calculated that 2 roubles 50 kopeks or 3 roubles small money per head of the population is sufficient; this would mean some 320 or 380 million roubles.

It is, of course, quite probable that the currency now successfully established would not be able to stand the strain of war. Russia would require all her enormous stock, and more, to purchase warlike stores, &c., as well as for the payment of her armies when once on foreign soil, though able to pay in notes for necessaries coming from home. But it is not probable that any country, except perhaps England, would attempt to carry on a serious war without immediately establishing a forced currency. If the war was not long, or terminated in success, Russia would not have any invincible difficulty to meet in paying off again in gold the new engagements and to resume a metallic currency.

As regards the emission into circulation of coin, many people are asking why the Government is taking such pains to issue it. They argue that, as far as external commerce is concerned, a fixed basis of exchange is all that is necessary, and that is now provided by the fixed rate; while, for all internal purposes, the note did perfectly well, and had the extra advantage of convenience and of being preferred among the people; that the fact of a certain amount of gold being in circulation is no real guarantee for the future, as, in the event of a war or any great public calamity, more notes would certainly be issued as a non-interest-bearing form of loan, and there would be great demand for gold, not only by individuals, but also by the State, and the very fact of that gold being in circulation would tend to depress, in comparison, the notes; and, finally, that the issue of gold has weakened the Government's resources by just the amount they have circulated.

The Minister of Finance, however, states that he "considers it very important that specie should be "practically in circulation. If this does not take "place, and if almost all the gold is concentrated in "the bank and the Treasury, then, should the time "come when specie flows out of the country, only the "bank and the Treasury would feel this practically. "The population which has satisfied its requirements "with the notes it has been used to, will scarcely be "quick at paying attention to the change in the "condition in monetary affairs, and, as has been found "by experience, will look with distrust and even with "hostility on the extra carefulness in bill-discounting "and money-lending which becomes necessary under "such circumstances. On the contrary, if gold coin "forms an essential part of the currency, the flow of "gold out of the country is not only from the safes of "the bank, but from the specie in circulation. The "scarcity of money is first of all felt by the population "itself; it takes its own measures against this, of "necessity trying to retrench its expenses or to increase "the productiveness of labour, and thus takes the first "step towards restoring the equilibrium of the "monetary balance. This essentially lightens the "task of the Government in preserving order in the "monetary affairs of the country."

Such are Mr. Witte's arguments; the measure certainly could hardly be termed "introducing a gold currency" if the gold remained exclusively in the bank; the scheme would not be fully realised under such conditions. The Government is perfectly well able to hold the market under ordinary conditions, and, though a serious crisis in any part of Europe might occasion such a demand for gold that the Russian Government could not, by the means it at present adopts, check the export of the metal, it could always in such a case revert to some extraordinary measure, such, for instance, as merely a prohibition of the export of gold.

There is, at present, no such prohibition, nor does there, indeed, seem to be need of one so long as the Government is ready *to buy or sell gold* at a certain rate—which rate varies every day—to meet the market. Thus, for instance, supposing gold to become dearer abroad than in St. Petersburg, the rate would be raised here in proportion, so that an individual would do better to sell to the Government here whatever gold he might buy in the market rather than to send it to the place where the rise in value had occurred, thus saving the expense and risk of transport.

This operation protects the gold already in circulation, and is one which the Government can perfectly well continue to carry out so long as it has anything approaching its present store of gold; and the knowledge that it is able to do so is enough to hinder people from trying speculative experiments. It is by these means that the Russian Government ensures itself against an adverse turn in the foreign exchanges, and secures the gold from demands for export; no general apprehension consequently is as yet expressed of a drain of the gold.

In former times when there was also no prohibition of the gold export, if an attempt was made to draw gold from the bank in large quantities for exportation, measures of various kinds were taken which caused the would-be exporter to understand that his proceedings were obnoxious, and to desist from repeating the attempt.

In the press, the French system of paying out a certain amount of silver together with the gold, has been much advocated, but the Russian Government had adopted a gold standard, and was unwilling to swerve from it in any degree.

The bank and the Treasury here represent, really, the same identity—the State. They are, in fact, merely departments of the Ministry of Finance. But it is the bank which is charged with the issue of notes, and with the payment of the same in coin (*vide* the Ukase of November 14, 1897), and therefore the bank ought at present to hold 699 millions in gold as reserve for the 999 millions of notes in circulation, in conformity with the Ukase of August 29, 1897. This leaves about 600 million roubles for the other needs of the bank and the Treasury, or to be a reserve in case of war, and this amount is increased, theoretically, by every rouble note that is destroyed.

However, the figures given above represent the amount of gold not only in the bank, but also in the Treasury. The bank indeed itself does not hold much; in accordance with the article which states that the notes are "guaranteed by all the resources of the State," the gold in the Treasury is counted as part of this guarantee.

The following are the balance sheets of the bank for December 23, 1897, to January 4, 1898, and March 1–13, 1898.

From these it follows that 59 millions of notes have been withdrawn, and while the coin in the bank has decreased by 6,661,786 roubles, the amounts in the branch offices and in the local treasuries have increased by 46,166,000 roubles and 10,536,000 roubles, the net result being an increase of 50,040,214 roubles.

Le gouverneur de la Banque de l'Etat : Ed. Pleské.

Le chef de la Comptabilité Centrale ; E. Slansky.

It must be remembered that in countries having a gold standard the amount of gold required for circulation is small in comparison with the other demands, under normal conditions. This is in great part due to the cheque system, which is almost entirely lacking in Russia, and great inconvenience is consequently felt, as heavy weights of cash have continually to be sent backwards and forwards. When once the Government have dispersed among the people as much gold as they think desirable, it seems likely that they may proceed to develop the cheque system, and thus at once lessen the amount of gold required for circulation and meet the public convenience.

A minor objection to the currency is that the half imperial, though equivalent to 20 francs, does not represent an *even* amount of Russian money (7 roubles 50 kopecks) or a multiple of five. At the discussion of the reforms it was proposed that a 10-rouble piece should be struck containing 7·742 grammes of gold, and that this should form the chief coin, but the proposal was rejected on the ground that it was necessary to adhere to the imperial in its old form, under the new denomination, that being sufficient change for the time.

The reform has lost to the Government one considerable source of profit, *i.e.*, gold is not subject like notes to destruction by fire or otherwise. On the other hand, the system of savings banks is not very widely developed here among the agricultural classes, and the hoarding of gold by the peasants will affect the Government quite differently to the hoarding of paper. The urban classes, however, deposit largely in the savings banks.

A notice has just appeared in the papers, both local and foreign, which is a corollary to the previous acts, stating that the interest on the internal loans (which were raised in credit roubles) will be paid to those that hold such stocks abroad at prices in any case not lower than 100 roubles = 266·67 francs = 216 marks = 10*l.* 11*s.* 5*d.*

St. Petersburg, April 6, 1898. T. B. Hohler.

April 12, 1898.

P.S.—Since writing the above, the intention announced by Mr. Witte in his Budget Report for this year, in regard to the silver coinage, has been carried into effect. An Imperial Ukase, under date of March 30 (April 11), is published in to-day's papers, which, after referring to the establishment of the rouble as equivalent to one-fifteenth of an imperial, and to the free exchange of notes for cash, in virtue of the Ukases of 1897, enacts the following, in order to give complete sequence to those Ukases and to the decree of July 16, 1893, forbidding the free coinage of silver for private persons.

I. The total of silver issued and in circulation, whether of full value coins (roubles, half roubles, and 25 kopek pieces) or of token money (20, 15, 10, and 5-kopek pieces), is not to exceed three times the number of the total population of the empire.

II. The maximum amount of legal tender of silver, which private persons are bound to accept, is fixed at 25 roubles. The local treasuries, however, and the public offices will receive it to any amount and for all payments, excepting for customs and other duties levied in gold, which must be paid in gold, unless the amount is less than five roubles (the smallest gold coin being of that denomination).

III. All calculations for all accounts, transactions, and business of whatever sort, are henceforth to be based on the rouble as the equivalent of one-fifteenth of an imperial.

T. B. H.

MISCELLANEOUS.

No. 60.

Memorandum by Professor Eduard Suess (Vienna) on the New Gold Discoveries.

(Received and read at a meeting of the Manchester Literary and Philosophical Society, April 5th, 1898.)

Referred to in Question No. 12,838.

Reference has lately been made in the Proceedings of the Society to my small book on "The Future of Gold," published in 1877, and a desire has been expressed to learn my opinion on the present situation. My opinion is that the succession of rich discoveries and the energy of mining operations accelerate the exhaustion of the resources in gold offered by nature to mankind, and at the same time hasten the approach of a universal economic danger.

When Germany, after the war of 1870, adopted the gold standard, the Government was supported by distinguished men, of well-deserved renown in economical affairs, but without the necessary deference to the geological side of the question. That is why, in 1877, I ventured to remind them that the production of silver would not be reduced in the ratio of the fall in its value, that the source of available gold would not be sufficient to provide a gold standard for the whole world, and that the epoch was inevitable, probably after a few centuries, when the production of gold must diminish steadily and in a high degree, and this metal, with increasing rarity, would no longer be able to retain its present economic position.

The evidence seems very clear. The Greek philosophers knew that gold was only found on the utmost frontiers of civilisation, and Humboldt emphasized the fact that all subsequent centuries have proved the truth of this observation. The same experience has occurred, since Humboldt's time, in Eastern Siberia, in the Rand, in Western Australia and on the Yukon, up to the present day. The rich discoveries have always been dependent on geographical expansion. Each such discovery has yielded gold to mankind through a certain time, according to the richness of the deposit and the energy of working, and has then ceased. Now, as the extent of unexplored country is limited, and the distribution of gold-bearing rocks within these districts is also limited, it must never be forgotten that the entire sum of gold still attainable by man is also a limited figure.

This constant displacement of mining operations forces them beyond the regions of congenial climate. The consequences are well shown in Mr. Goodrich's description of gold-mining on the Yukon, contained in Spurr's excellent Alaskan Report to the U. S. Geological Survey. Firstly, we must remember that all gold from the Yukon comes from placers, and consequently cannot be compared to the gold won at the Treadwell Mine, Alaska, which is mined under wholly different and exceptionally happy circumstances on Douglas Island, near the entrance to Lynn channel. The Cassiar district, near Dease Lake, British Columbia, is of the same type as the Yukon placers. This district gave 1,000,000 dollars in 1874, then receded gradually to 22,000 dollars in 1895, and is now exhausted. Cassiar has given experienced prospectors and miners to the Yukon district. But here, on the banks of the Yukon, frost reigns through eight months of the year.

The prolonged and intense cold is a serious impediment to placer work and only the richest deposits can pay. Gold of coarse grain is, by the high specific gravity of the metal, much easier to separate from the wash dirt than the fine gold particles of even a rich silt. Therefore, the prospectors push up to the higher parts of the creeks, where frost and snow are even more excessive, food is wanting, and every sort of transport becomes extremely difficult. In some places, the miners melt the frozen ground by fire, sink shafts, and throw out the pay-dirt for washing during the short summer. But, as the number of persons who endure all these hardships is small, only the richest places are worked, and every new and better find causes the desertion of the old place.

In 1886 Stewart River was abandoned when Forty Mile Creek was discovered, and in 1896 Forty Mile Creek was quitted for Klondike. The consequence is a very incomplete harvest. It is improbable that hydraulic arrangements in this severe climate will pay, and the establishment of quartz mining is likewise held improbable by authorities.

The production from the placers of all the Alaskan river valleys in 1896, together with the Yukon creeks on British territory, but without those on Cook's Inlet on the seaboard, was estimated by the Alaskan Mining

Record at 2,170,000 dollars, and by Mr. Goodrich at 1,700,000 dollars, showing how difficult it is to obtain trustworthy figures from districts of this kind.

In comparing the various fluctuations which the world's production of gold shows since the early ages, I, in 1877, thought myself entitled to suppose that these fluctuations would continue during the next few centuries until the time of final exhaustion. This supposition was erroneous. The facilitation of every sort of communication which has taken place during these 21 years, the immense expansion of the white race, the magazine rifle, the increased experience of the prospector, the fabulous credulity of the mass risking thousands after thousands in *l.* shares on enterprises with but the faintest spark of hope, and many other circumstances, combine to the effect that, *in place of the continued fluctuations*, presumed by me in 1877, *the whole production of the world now tends to unite into one great wave*, and, consequently, to hasten the end, and to increase the danger. It is a further consequence of this state of things, that the distance of this end may no longer be measurable by centuries.

But, along with this increase of the world's production, every sort of activity has increased all over the world, hundreds of new exigencies have arisen, and the question may be raised whether the production of gold and the new necessities have grown in a comparable manner during recent years.

Every figure in these matters can only be more or less rudely approximate. The figures of production, of export and import of gold, which I beg leave to cite below, are taken from the last excellent publication of the United States Director of the Mint, Mr. Preston. I am aware that in these figures the production of gold for the United States is given for the calendar year as for the rest of the world, and the figures of export and import are given for the United States fiscal year ending June 30th. This may displace a part of the figures, but cannot affect the general conclusion.

In 1887 the world's production had decreased to 21·8 millions sterling, and from that time the rise was constant, until in 1897 50 millions sterling was reached; the estimate for 1898 is 55 or 56 millions sterling.

Three-quarters of this sum is produced by four parts of the world: Australia, South Africa, Russia, and the United States. It is a very wide-spread delusion that these four countries really deliver up all their gold to the world's use. In reality, the case is very different.

Let us only consider the last four years, 1893–96, for which we possess the necessary figures.

The net export of gold from *Australia* during these four years teaches that one-half of the production (82 million dollars out of 167 million dollars) was retained for home purposes, and only one-half was exported.

South Africa, in the same time, retained about 31 per cent. of her production, and delivered up 69 per cent. (108 million dollars out of 158·2 million dollars).

Russia, during all these years, shows high figures of net import. We see that Russia retained all her own production, and continued to draw gold from other parts of the world.

The *United States* have, under the influence of economic changes, exported in some years a greater and in others a smaller part of their production; it has even happened that they have exported more gold than was produced. But since the middle of 1896 the current has wholly changed. Since that time they also have retained all their production, and drawn on the rest of the world.

If you will take the trouble to subtract the production of these four countries from the production of the world, and add their net export to the rest (always basing on Mr. Preston's figures), you may obtain the approximate sum of new gold really left to the disposal of the rest of the world during this time.

These figures are:—

1893, world's production 33·0 millions sterling reduced to 16·8 millions sterling.
1894, world's production 38·0 millions sterling reduced to 14·1 millions sterling.
1895, world's production 41·8 millions sterling reduced to 28·7 millions sterling.
1896, world's production 42·6 millions sterling reduced to *minus* 1·7 millions sterling.

This means a world's production of 38·7 millions sterling per annum, out of which only 14·5 millions sterling per annum were at the disposal of the world, excepting the four countries named. At the same time the variability of the reduced figures may be seen (one of them showing even a negative result), and the treacherous character of averages. But, although the production varies, the variability of demand is incomparably greater, having regard to quantity as well as to origin. It may be said that the bad harvest in Europe, and Russia's preparations for a gold currency, are claims of a temporary and passing character which give abnormal figures. But the demands are very often of a temporary character, and it is a justifiable requirement that the disposable quantity of gold should be adequate even to meet much stronger claims; let us not speak of war.

In 1897 the position was no better, and it is hard to assume that it will be much improved in 1898.

In *Australia* the export of agricultural produce is rather retrogade, English capital has also been withdrawn, and therefore Australia gives more gold; the export of gold to Europe has been strong in 1897 and is expected to be considerable in 1898 (say 11 to 13 millions sterling).

South Africa delivers up a great part of her increasing production, but part of the outcrop mines on the Rand have already closed up; the life of others is reckoned approximately to last four or five years longer. The life of the deep levels is estimated by mining authorities at about 25 years. Let us accept these figures. South Africa is now not only one of the very first producers, but also delivers up the greatest part of her gold, and let us ask, What after 25 years?

Russia has continued her gold policy, she has retained her own produce (6·5 millions sterling or more) and has continued to import foreign gold. Mr. Witte's last report says that in 1897, 10·9 million dollars have been added to the Government's gold treasure, besides very large sums of gold which entered into commerce.

The *United States* in 1897 likewise retained their own production (11 millions sterling), and continued to draw on the rest of the world. Their net export in trade in 1897 amounted to about 70 millions sterling. During recent years a certain amount of American railway securities seems to have returned homewards, thus narrowing one of the channels by which Europe received American gold.

Besides these variable contingencies, and besides the hoarding of gold treasure by Austria-Hungary and Japan, there appear a great number of exigencies which are not temporary but are constantly increasing. I first mention the consumption of gold in the arts and industries, which for the world (excepting the said four countries) is estimated at about nine millions sterling per annum. Then comes the increasing demand for circulation in the very few parts of Europe which possess a gold currency. Everybody feels the necessity of reinforced metallic reserves for banking institutions to face the quite incalculable quantity of paper values and the manifold kinds of liabilities. Let me call to your mind that the increase of business of the Deutsche Reichsbank in 1897 alone amounted to 500 millions sterling, that the demands for new capital at London were 49·1 millions sterling in 1893 and rose to 91·8, 104·7, 152·8 in the three succeeding years respectively, and in 1897 to 157·2. I do not add more figures, as we all live in the midst of the bee-hive ourselves.

The effect of all this is *that, although the world's production of gold is more than twice as great as it was ten years ago, still the struggle for gold is, to say the least, quite as sharp as it was then.*

But all this is only one side of this disastrous affair. Now come the consequences of the yearly increasing difference in the relative values of gold and silver. I do not intend to speak of the influence of this fact on prices, nor on different branches of industrial and agricultural activity, but I wish to say a few words on Asia.

India has from 1893 to 1896 produced 18·55 millions sterling of gold. Exports and imports of gold have been extremely variable; still India had a net import of 2·29 millions sterling for these years, so that the Indian production also was not delivered up to Europe. But this home production is of small account for the country. India, deeply and innocently injured by the all of silver, now hardly strong enough to bear the burden of her debts amounting already to about 18 millions sterling in gold per annum, loaded with new gold debts to pay old interest and with new experiments; the same India to which in 1892 an eminent Indian statesman thought to assure a gold circulation by means of merely 15 millions sterling, and which is now, six years later and after the great increase of the world's production, haunted by the spectre of a gold

standard without gold: this vast and rich empire, blessed by nature and sprinkled with the blood of so many of England's noblest children, is at this moment a deterring way-mark on the path which China is being forced to enter. Can any earnest man, casting his eye over the world's increasing traffic, and over this great and increasing gold monetary movement, which we are witnessing, I say, can anyone believe that this process may be called upon by a modern Joshua to stand still at 1*s.* 4*d.*? But is not this forced application of a foreign standard the resurrection of that colonial policy of past times, condemned by history and by civilisation? Does advanced Europe, proud of her Christianity, indeed think of subduing foreign nations by giving to each of their liabilities an ulcerating character? Do enlightened statesmen not perceive, *that in Asia*, that ocean of mankind, *no reasonable policy of whatever direction is compatible with a gold standard*?

These are the conditions under which we float towards a great monetary crisis. Yukon will not be the last of the rich discoveries. Some others probably are still reserved for the near future, be it on the north of the Kuenlun Range, or in Central Africa, in Siberia, or in any other distant part of the world. Other sources will decline, but, *in toto*, the world's production will for some time continue to increase. The necessities of mankind will also continue to increase, and probably even in a higher degree. Then the apex of the wave of production will be attained, the final decrease of gold will begin, but the necessities of mankind will continue to increase. Perhaps America will in the meantime decide upon the free coinage of silver, and, setting up a monetary barrier right across the traffic of the world, will defer the final crisis of gold. We cannot foresee the single events, but we can see the line of drift.

Germany has loosened the old tie of gold and silver, without anticipating the consequences. In the long run the profits have, without any merit, fallen to the bondholders, and the losses, without any fault, to the debtors. The holders of foreign securities in England are actually in the first line responsible to the world for the continuation of this state of monetary affairs, so perilous also for themselves.

I know well that personal interest is a very strong item, but national interest is a stronger item, and, when national interest speaks, personal interest must rest silent. But the interest of humanity is a stronger item still, and, even if national interest should eventually point another way, which I contend is not here the case for England, the common interest of humanity must prevail. A great nation, claiming to be a leading member of mankind, must feel this as a duty.

No. 61.

LETTER from Mr. ROBERT BARCLAY with reference to Questions 11,666 and 12,016.

Sedgley Hall, Prestwich,
Manchester,
April 25, 1899.

DEAR SIR HENRY,

I OBSERVE in Volume 2 of Minutes of the Evidence taken by the Currency Committee that Mr. O'Conor, in answer to 12,016, states that some newspaper or publication quoted a telegram purporting to be addressed by Mr. Forbes Mitchell, of Calcutta, to the President of the Indian National Congress, to the effect that "Mr. Barclay, Chairman of the Manchester "Chamber of Commerce, hopes the National Congress "will protest against a gold standard," and he stated further that this was an illustration of attempts made from England to excite dissatisfaction, though he admitted that a resolution of protest had been passed before receipt of such telegram.

I desire to give an unqualified contradiction to the suggestion put forward by Mr. O'Conor, or that I was concerned in this matter. As I mentioned when I informed the Committee (11,666) that I had received a telegram from the President of the Indian National Congress, I do not know that gentleman, and my correspondents in India have no connexion with the Congress—and to these facts I would add that I made no communication whatever to Mr. Forbes Mitchell upon the subject.

I feel it due to myself to address you on this matter, and, in order to prevent any misconception, I would ask that you will kindly allow this letter to appear in the Appendix.

I remain, &c.
ROBERT BARCLAY.

The Right Hon.
Sir H. H. Fowler, G.C.S.I., M.P.

No. 62.

LETTER from Sir W. WEDDERBURN, Bart., M.P., with reference to Questions 12,015–6.

Office of the British Committee,
Indian National Congress,
84, Palace Chambers,
Westminster, S.W.,
June 22, 1899.

SIR,

THE statements contained in Mr. J. E. O'Conor's replies to Questions Nos. 12,015 and 12,016 in the Evidence of the Indian Currency Committee, have excited much comment in India; and I have been requested by Mr. D. E. Wacha, Hon. Joint General Secretary of the Indian National Congress, to point out to your Committee that Mr. O'Conor is under a misapprehension as regards the origin of the Currency Resolution passed last Christmas by the Indian National Congress. Mr. O'Conor appears to be under the impression that this Resolution was prompted by a telegram sent by the Chairman of the Manchester Chamber of Commerce, expressing a hope that the Congress would protest against the gold standard. Had this telegram been received while the Congress was preparing or discussing the Resolution, the communication would, no doubt, have received the respectful attention due to so high an authority. But such was not the case. As a matter of fact the telegram did not reach the hands of the President of the Congress until some time after the speeches on the Currency question had been made, and the resolution carried.

But irrespective of the date on which the telegram reached the Congress, it is evident that Mr. O'Conor was ignorant of the procedure according to which resolutions are drafted for submission to the Congress. Before any resolution is submitted to the Congress the draft is circulated for approval to the different Congress circles in all parts of India. This is done about two months before the date of the Congress, and the opinions thus obtained are considered by the Subjects' Committee, and the draft is revised and, if necessary, amended before submission to the Congress. This was exactly what was done in the case of the Currency resolution. The topic had become inevitable owing to the proceedings of the London Currency Committee, and the whole subject had been freely discussed in the Indian community and the press months before the date of the Congress. Looking to these facts it is evident that Mr. O'Conor's suggestion, that the Congress Resolution was prompted by a telegram received from Manchester at the last moment, could not possibly have been true; and it is much to be regretted that a gentleman who holds the office of Director General of Statistics, and appeared as a witness on behalf of the Indian Government, should have permitted himself to make such a reflection upon an important representative body without first ascertaining the correctness of the facts upon which his inference was based.

Such being the case, Mr. Wacha is naturally anxious that the real circumstances should be known; and I shall esteem it a favour if you will communicate this letter to your committee with a view to its appearing as an appendix to the final proceedings of that body.

I have, &c.,
W. WEDDERBURN,
Chairman, British Committee,
Indian National Congress.

The Right Hon.
Sir H. H. Fowler, G.C.S.I., M.P.

APPENDIX II.

FINANCIAL AND STATISTICAL TABLES.

A. *Tables and Diagrams received from the India Office.*

1. EXPORTS of MERCHANDISE, GOLD, and SILVER, on PRIVATE and on GOVERNMENT ACCOUNT (so far as this is distinguished), 1850–51 to 1898–99.

2. IMPORTS for the same period.

3. NET TRADE on PRIVATE ACCOUNT for the same period.

4. IMPORTS of STORES on account of the GOVERNMENT, distinguishing Railway Materials from other Stores, 1872–73 to 1898–99.

5. NET IMPORTS of GOLD and SILVER, showing the Weight and Value, 1887–88 to 1898–99.

6. AVERAGE RATE of EXCHANGE for BILLS and TELEGRAPHIC TRANSFERS on India, 1850–51 to 1898–99.

7. NET AMOUNT of REGISTERED DEBT in INDIA, borrowed, paid-off, and enfaced for payment of Interest in London, 1850–51 to 1899—1900.

8. AMOUNT of CAPITAL PAID by Railway or Irrigation Companies into the Government Treasuries in India or raised by Railway Companies in India, 1850–51 to 1899–1900.

9. NET DISBURSEMENTS in ENGLAND from 1850–51 to 1898–99, inclusive, and the mode in which those disbursements were provided for.

9A. GOVERNMENT REMITTANCES from INDIA, RECEIPTS from IMPERIAL GOVERNMENT, &c.

9B. CAPITAL RAISED and WITHDRAWN in LONDON by Guaranteed Railway and Irrigation Companies.

9C. DEBT INCURRED in LONDON (excluding debt incurred for Purchase of Railways or Canals, or to pay off Debentures issued by Railway and Irrigation Companies); also CAPITAL OUTLAY IN ENGLAND on RAILWAYS and IRRIGATION WORKS for which no specific debt has been incurred in London.

10. INDIAN STERLING DEBT, 1878–99, showing Debt assumed to have been incurred for Railways and Irrigation Works.

11. Sterling payments, 1878–99, on account of INTEREST on DEBT and ANNUITIES created in PURCHASE of RAILWAYS.

12. PRICE of SILVER; RATE OF EXCHANGE; CHARGE for EXCHANGE; SURPLUS or DEFICIT in the ACCOUNTS of the INDIAN GOVERNMENT for the Years 1872–73 to 1898–99.

13. DIAGRAM showing RATE OF DISCOUNT at PRESIDENCY BANK of BENGAL from 1861 to 1899.

14. AVERAGE MINIMUM RATE of INTEREST at BANK OF BENGAL for each half-year from 1854 to 1898.

15. DATES of CHANGES in the MINIMUM RATE of INTEREST of the BANK of BENGAL from 1874.

16. DIAGRAM showing the INTRINSIC and EXCHANGE VALUES of the RUPEE and the LONDON PRICE of SILVER, 1892–99.

17. PRICE of BAR SILVER in BOMBAY from 1893 to 1899.

18. PRICE of BAR GOLD in INDIA from June 1893.

19. COINAGE of SILVER in INDIA from 1850–51 to 1898–99.

20. GOVERNMENT CASH BALANCES in INDIA on the last day of each month, 1876–77 to 1898–99.

21. Monthly CASH BALANCES held in India by GOVERNMENT and by PRESIDENCY BANKS, 1888–99.

22. CAPITAL RAISED in ENGLAND by INDIAN RAILWAY COMPANIES not GUARANTEED by the SECRETARY OF STATE, 1870 to 1898.

23. QUANTITY of SILVER ACCEPTED and PASSED into MINTS by NATIVE STATES, 1891 to 1898.

24. NET CIRCULATION of CURRENCY NOTES, 1887–88 to 1898–99.

25. RATES of REMITTANCE to and from INDIA, 1893–99.

B. *Tables and Diagrams prepared by Mr. J. E. O'Conor, C.I.E.*

26. Indian and Sterling PRICES of certain COMMODITIES from 1888.

27. Variations in WHOLESALE PRICES of EXPORTS at CALCUTTA, BOMBAY, and RANGOON.

28. Variations in WHOLESALE PRICES of IMPORTS at CALCUTTA.

29. Diagram illustrating the two preceding Tables.

30. Variations in the RETAIL PRICE of RICE since 1861.

31. Variations in the RETAIL PRICE of WHEAT since 1861.

32. Variations in the RETAIL PRICE of JAWAR since 1861.

33. Variations in the RETAIL PRICE of BAJRA since 1861

34. Variations in the RETAIL PRICE of RAGI since 1861.

35. Variations in the RETAIL PRICE of GRAM since 1861.

36. Variations in the RETAIL PRICE of BARLEY since 1861.

37. Variations in the RETAIL PRICE of the SEVEN FOOD-GRAINS mentioned in Nos. 30 to 36.

38. Diagram illustrating No. 37.

39. Variations in WAGES of SKILLED and UNSKILLED LABOUR.

40. Abstract of No. 39.

41. WAGES of POSTAL RUNNERS and POSTMEN.

42. Diagrams illustrating the comparative levels of PRICES and WAGES in India.

43 and 44. WAGES in COTTON MILLS at CAWNPORE.

45. WAGES in the ARMY EQUIPMENT FACTORY, CAWNPORE.

46. WAGES in the BREWERY at RAWAL PINDI.

47. REVENUE and EXPENDITURE of INDIA, 1873–74 to 1898–99; Amount of DEBT and CAPITAL OUTLAY on PUBLIC WORKS at end of 1873–74 compared with AMOUNT at end of 1898–99.

48. RAILWAY REVENUE and EXPENDITURE, 1875–76 to 1898–99.

49. OFFENCES AGAINST THE COINAGE, 1889 to 1897.

50. IMPORTS and EXPORTS of GOVERNMENT RUPEES from October 1893.

51. EXPORTS of MERCHANDISE (Values) and RATE of EXCHANGE, 1876–77 to 1898–99.

52. EXPORTS of STAPLE ARTICLES OF TRADE (Quantities) and RATE of EXCHANGE, 1885–86 to 1898–99.

53. REVENUE from each SOURCE of TAXATION in India, 1885–86 to 1899–1900.

54. Diagram illustrating No. 51.

55. Diagram illustrating No. 52.

56. Diagram illustrating No. 53.

C. *Tables and Diagrams handed in by Witnesses and others.*

57. Figures relating to EXPORT of TEA from CHINA (*Sir A. Dent*).

58. IMPORTS and DELIVERIES of TEA, 1886 to 1898 (*Mr. W. J. Thompson*).

59. Mr. Sauerbeck's Index Numbers of Commodities and Silver (*Mr. Cheetham*).

60. EXPORTS from INDIA and RATE of EXCHANGE (*Mr. Cruickshank*).

61. PRICES in INDIA, 1892 to 1895 (*Mr. Dutt*).

62. Diagram showing BANK OF BENGAL RATE and IMPORTS of SILVER, 1870 to 1897 (*Mr. Cheetham*).

63. Diagram of PRICES of certain GRAINS at MEERUT, 1861–98 (*Sir A. P. MacDonnell*).

64. Diagram of PRICES in INDIA and ENGLAND: GENERAL COMMODITIES in ENGLAND (gold and silver prices) from 1846 to 1897; SILVER in LONDON from 1846 to 1897; GENERAL COMMODITIES and WAGES in INDIA from 1861 to 1896; INDIAN IMPORTS from 1873 to 1898; INDIAN EXPORTS from 1873 to 1894 (*Professor Marshall*).

65. Diagram showing FOOD PRICES in INDIA from 1861 to 1895; RAINFALL in INDIA from 1861 to 1896; RATE of DISCOUNT in CALCUTTA (Bank of Bengal) from 1860 to 1897; and RATE of INDIAN EXCHANGE on ENGLAND from 1861 to 1898 (*Professor Marshall*).

66. Diagram showing NET IMPORTS of GOLD and SILVER into INDIA, RATE of INDIAN EXCHANGE on ENGLAND, and LONDON PRICE of SILVER, from 1860 to 1897 (*Professor Marshall*).

67. Diagram showing RATE of INDIAN EXCHANGE on ENGLAND from 1870 to 1897; IMPORTS of COTTON PIECE GOODS into INDIA from 1870 to 1896; and EXPORTS of WHEAT from INDIA from 1873 to 1897 (*Professor Marshall*).

68. Diagram showing the PRICE of JAWAR from 1861 to 1896 (*Professor Marshall*).

69. Diagram showing course of WAGES and PRICES in UNITED STATES from 1860 to 1891 (*Professor Marshall*).

1861-62	7,070,830	783,079	8,887,248	—	The Mint Report for 1876-77, says: "In transmitting accounts for 1875-76 no reference was made to country silver and ornaments tendered for coinage by native merchants. This was because the quantity tendered was not so excessive as to render any special remarks necessary." The Report then gives the monthly receipts from April 1876 to July 1877, and remarks that these bring the total amount tendered under the pressure of famine since November 1876 to about half a crore of rupees.

‡ Value of old rupees received for re-coinage.

§ These figures do not include the British dollars which, under an agreement between the Secretary of State for India on the one side and the Hong Kong and Shanghai Banking Corporation and the Chartered Bank of India, Australia, and China on the other side, are coined at the Bombay Mint for circulation in Hong Kong and the Straits Settlements. The number of British dollars coined was as follows: 1895-96, 3,316,063; 1896-97, 6,135,617; 1897-98, 21,286,427; 1898-99, 21,545,564. For native states there was in 1897-98, a coinage of Rx. 486,472, and in 1898-99 a coinage of Rx. 417,960.

No. 23.

QUANTITY of SILVER (in Tolas) accepted and passed into MINTS in NATIVE STATES from 1891 to 1898.

Mints.	1891.	1892.	1893.	1894.	1895.	1896.	1897.	1898.	Remarks.
				1.—*Mints in Rajputana.*					
Bharatpur - -	—	—	—	—	—	—	—	—	Silver is received freely from the public; but no silver has actually been coined since 1889.
Bundi - - -	1,060,663	1,180,105	1,212,940	—	—	43,467	483,167	69,169	Silver is freely received from the public.
Jaisalmir -	18,700	27,825	209,122	59,978	78,950	104,281	84,319	—	Mint closed to the public since September 1893; but the Darbar coins its own silver.
Jaipur -	1,396,643	1,669,161	1,717,749	1,375,819	1,642,803	1,677,498	1,617,917	164,508	Mint closed from 27th December 1893 to 10th March 1894, but open throughout the years 1895, 1896, and 1897. The State buys the silver from bankers who are authorised to import silver on account of the Darbar; the bankers receive only the market value of the silver *plus* transit charges. So that the coinage is on account of the State.
Kishengarh - -	34,476	34,637	32,074	129,497	125,948	42,799	60,980	54,456	Mint closed to the public during July, August, and September 1893. Reopened in October under certain restrictions, in view to suppression of speculative coinage. Remained open throughout the years 1895, 1896, and 1897.
Jhallawar - -	86,749	309,913	279,385	474,724	493,983	—	—	—	Mint closed on 1st September 1893 to free coinage, and silver admitted only by special permission given solely for silver purchased for importation into the State prior to closing of the mint, and for ornaments brought for conversion into coin. Reopened on 1st April 1894 to free coinage, a seignorage of 10 per cent. being imposed on bar silver. In July 1894 rate reduced to 6 per cent., but again raised to 10 per cent. in September 1894. The mint has remained closed since 1896.
Karowli - -	15,826	21,820	207,523	41,927	12,147	97,849	48,191	15,169	Closed since 30th December 1893 to free coinage; coining only for the State when necessary.
Kota - - -	466,910	123,759	257,156	27,555	17,198	21,268	20,316	18,029	Mint closed on 7th August 1893. On 21st December 1893 permission given to coin broken silver ornaments, subject to a limit of Rs. 20,000 in the year.
Marwar — Jodhpur -	12,300	228	1,458,562	441,095	189,378	729	6,715		Silver is freely received from the public.
Marwar — Pali -	30,004	20,252	1,056,707	507,444	46,539	2,432	306	14,374	
Marwar — Nagore -	—	—	231,471	79,194	—	—	—		Mints opened in September 1893.
Marwar — Kuchawan	—	—	157,639	34,753	21,590	—	—		
Udaipur -	416	1,544	46,078	10,755	53,640	60,116	58,493	195,392	No silver imported or purchased locally by the State since June 1893. Coinage of small silver from old stock of silver possessed by the State continues to meet requirements of State.
Pratabgarh -	3,304	8,593	1,045,687	975,778	1,943	—	88,749	—	Mint closed since 1st May 1894, except for the coinage of small silver and copper. The coinage in 1897 was for State requirements.
Tonk and Sironj -	48,601	126,470	113,147	3,749	—	—	32,157	—	These mints are at present closed. The coinage of 1897 represents re-coinage of Mahamed Khani rupees into Chauhar Shahi rupees.
TOTAL FOR RAJPUTANA - -	3,174,592	3,524,307	8,025,240	4,162,268	2,684,119	2,050,439	2,501,310	531,097	

QUANTITY of SILVER (in Tolas) accepted and passed into MINTS in NATIVE STATES from 1891 to 1898—*continued.*

Mints.	1891.	1892.	1893.	1894.	1895.	1896.	1897.	1898.	Remarks.
				2.—Mints in Central India.					
Indore - -	3,590,563	3,108,356	3,078,667	1,555,349	380,966	4,314,170	1,091,530	—	The Darbar purchases the silver for coinage when necessary. Does not coin for the public.
Gwalior { Bilsa -	169,023	302,376	570,102	145,594	—	—	—	—	Mint closed in October 1893. Coin struck for the use of the State only when necessary.
Gwalior { Ujjain -	133,034	66,786	1,152,319	1,152,927	977,449	1,451,212	1,343,229	170,129	Coin not supplied to the public since 10th April 1893. Coin struck for the use of the State only when necessary.
Gwalior { Lashkar -	226,351	628,232	228,865	5,650	—	—	—	—	Mint closed on 26th November 1891; coin for the use of the State only struck when necessary.
Bhopal - -	631,588	719,114	11,820	—	—	—	—	—	Mint closed on 4th August 1893, closure being complete both as regards public and State. The British rupee has been introduced as the sole legal tender from 1st February 1898, and the State has undertaken not to coin any silver at its mint.
Orchha - -	489,888	475,968	404,090	49,693	—	800	3,969	4,331	Mint closed since 1st March 1894. The coinages in 1896 and 1897 were struck on the occasion of the Basant Festival, and were on account of the State
TOTAL FOR CENTRAL INDIA -	5,240,447	5,300,832	5,445,863	2,909,213	1,358,415	5,766,182	2,438,728	174,460	
				3.—Mint in Hyderabad.					
Hyderabad - -	2,135,179	2,183,354	2,333,118	705	299,971	418,007	168,945	356,505	Mint closed since 1st July 1893, but some coin struck in October 1893 and February 1894, from silver obtained by washing crucibles. The coinage of 1895, 1896, and 1897 consisted mainly of re-coinage of Hali Sicca rupees.
				4.—Mints in Bombay.					
Junagad - -	—	—	—	—	—	88,729	61,037	2,840	The mint coins only State silver. The coinages of 1896 and 1897 were undertaken to replenish the supply of the State coin.
Cambay - -	721	—	—	—	17,920	57,680	88,084	—	The mint is open to public coinage, but the State has option to refuse or accept a tender.
Kutch Bhooj - -	254	124	2,324	704,665	1,467,371	492,360	1,113,639	991,400	Prior to 1894 the State had abstained from coining for some time, and there was a scarcity of coin. The coinages of recent years have been undertaken to replenish supply. The State does not appear to coin for the public.
Radhanpur - -	—	—	—	94,129	—	—	—	—	Radhanpur buys its silver in the market, and coins when necessity arises. Navanagar Darbar also purchases silver from local merchants when it sees that an issue of coins from the State mint can be made with profit, and the coins are issued to the merchants in payment of the silver brought from them. Radhanpur and Navanagar proposed currency reforms, but nothing has as yet been settled.
Navanagar - -	44,199	378,683	1,144,124	342,614	—	—	—	—	
TOTAL FOR BOMBAY - -	45,174	378,807	1,146,448	1,141,408	1,485,291	638,769	1,262,760	994,240	

No. 23—*continued.*

QUANTITY of SILVER (in Tolas) accepted and passed into MINTS in NATIVE STATES from 1891 to 1898—*continued.*

Mints.	1891.	1892.	1893.	1894.	1895.	1896.	1897.	1898.	Remarks.
				5.—Mint in Baroda.					
Baroda - -	86,794	3,683,276	2,525,393	9,791	4,871,016	3,183,417	1,485,477	1,415,535	Mint closed on 31st May 1893. Closure was complete, except that a few rupees were coined as samples:— Rs. December 1894 - 13 January 1894 - 4 September 1894 - 2 Heavy coinage in 1895, 1896, and 1897 mostly due to re-coinage of old coin, a rupee of new device and superior workmanship having been introduced.
				6.—Mint in Madras.					
Travancore -	13,039	23,274	32,336	3,046	—	8,704	27,063	38,051	The Darbar does not receive silver from the public. The coinage in 1897 was for the State only.
				7.—Mints in the Punjab.					
Patiala - -	123,760	180,067	51,564	—	—	250	250	250	Mint closed in July 1893, but all silver received before that date was ordered to be coined. Some silver was also coined in November 1893 through a misunderstanding on the part of mint officials. The coinages of 1896 and 1897 were on the occasion of the Dasserah and Dewali festivals.
Nabha -	—	—	—	—	—	—	—	—	The mint is open to free coinage, but the State reserves the right to refuse or accept any tender.
Jind - -	—	—	—	—	—	—	—	—	Silver is only coined on marriage occasions, or on the occasion of the installation of any new Raja.
Maler Kotla - -	—	—	10,751	64,533	25,840	—	61,927	76,980	Mint open to free coinage, but State reserves right to refuse or accept any tender.
TOTAL FOR THE PUNJAB - -	123,760	180,067	62,315	64,533	25,840	250	62,177	77,230	
				8.—Mint in Kashmir.					
Kashmir - -	240,390	238,269	366,621	502,197	251,152	—	—	—	Coinage of 1895 was mostly re-coinage of old coins. Mint closed from 10th Assoj (25th September 1895). British rupee is being introduced, and will become the sole legal tender after 30th April 1898. The State has undertaken not to coin any silver at its mint.

TOTAL QUANTITY of SILVER (including Re-coinages of OLD COIN) received in all the MINTS in NATIVE STATES in INDIA.

Note.—On 31st March 1898 the Assets of the Currency Department were as follows:—(i.) Silver coin, Rx. 14,528,634; (ii.) Gold, Rx. 255,420; (iii.) Government Securities, Rx. 9,999,994. On 31st March 1899 the Assets were, (i.) Silver coin, Rx. 15,150,109; (ii.) Gold, Rx. 3,053,172; (iii.) Government Securities, Rx. 9,999,994.

* Net Circulation.—A note is in "gross circulation" when it is not yet returned to the original office of issue; but if it has meantime been paid off by another office of issue, and is held by it pending return to the original office of issue, then it has ceased to be in "net circulation," though it is still part of the "gross circulation." "Net circulation" includes the value of notes held by Government in the Reserve and other treasuries.

J. E. O'CONOR.

No. 29.

DIAGRAM illustrating the two preceding Tables.

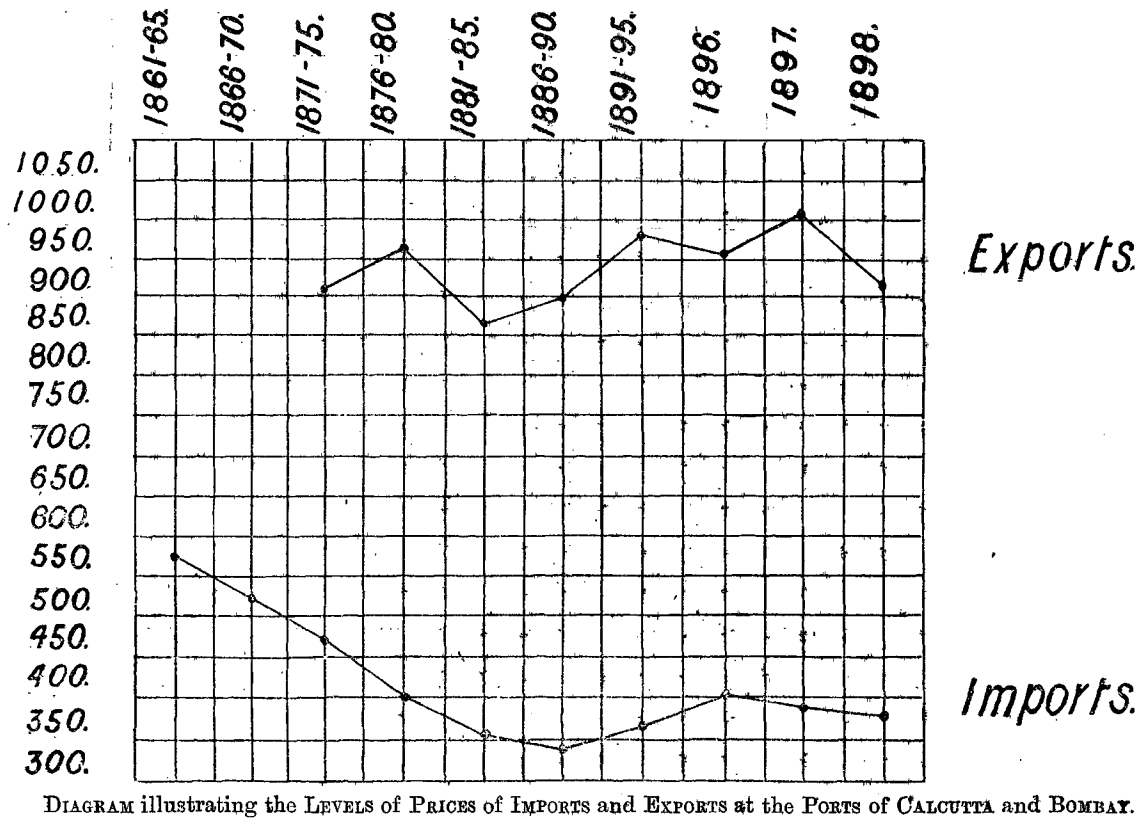

DIAGRAM illustrating the LEVELS of PRICES of IMPORTS and EXPORTS at the PORTS of CALCUTTA and BOMBAY.

The line of imports represents the totals of the prices of grey cotton shirtings, mule twist (grey and dyed), copper, and iron. (Level of 1873 = 100.)

The line of exports represents the totals of cotton, rice, wheat, linseed, jute gunny bags, tea, cotton yarn, and indigo. (Level of 1873 = 100.)

J. E. O'CONOR.

(Diagram by Mr. J. A. Anderson and Mr. H. M. Ross referred to in No. 30).

The position of the Indian money market is directly regulated by the amount locked up in the Treasury. As taxes are collected cash is withdrawn from private hands, and when the Treasury balance is reduced, the accumulations of private money in the hands of the three Presidency Banks increase proportionately.

A. 1 Crore of Bills bought on India, put into the Treasury, and paid out again at once, so hardly shows in the Treasury balance. It took six weeks to filter back into the Banks' hands, their cash rising to 4 crores on 20 Nov. B. 25 lakhs of gold paid into the note reserve, Treasury setting free the same amount of rupees. (*Note.*— Treasury balance includes the Reserve balance and cash and notes of the public deposits in the Presidency Banks. Cash in the three Presidency Banks consists of the cash and notes after deducting said public deposits.)

No. 37.—VARIATIONS in the RETAIL PRICE of the SEVEN FOOD-GRAINS mentioned in Nos. 30 to 36—
(Price of 1873 = 100).

[NOTE.—In this table the average has been taken of the prices at the stations mentioned in the foregoing tables in regard to each grain. This average may be taken to represent the general level of price of each grain in the tracts where it is most largely produced and consumed.]

Year.	Rice.	Wheat.	Jawar.	Bajra.	Ragi.	Gram.	Barley.	Total.

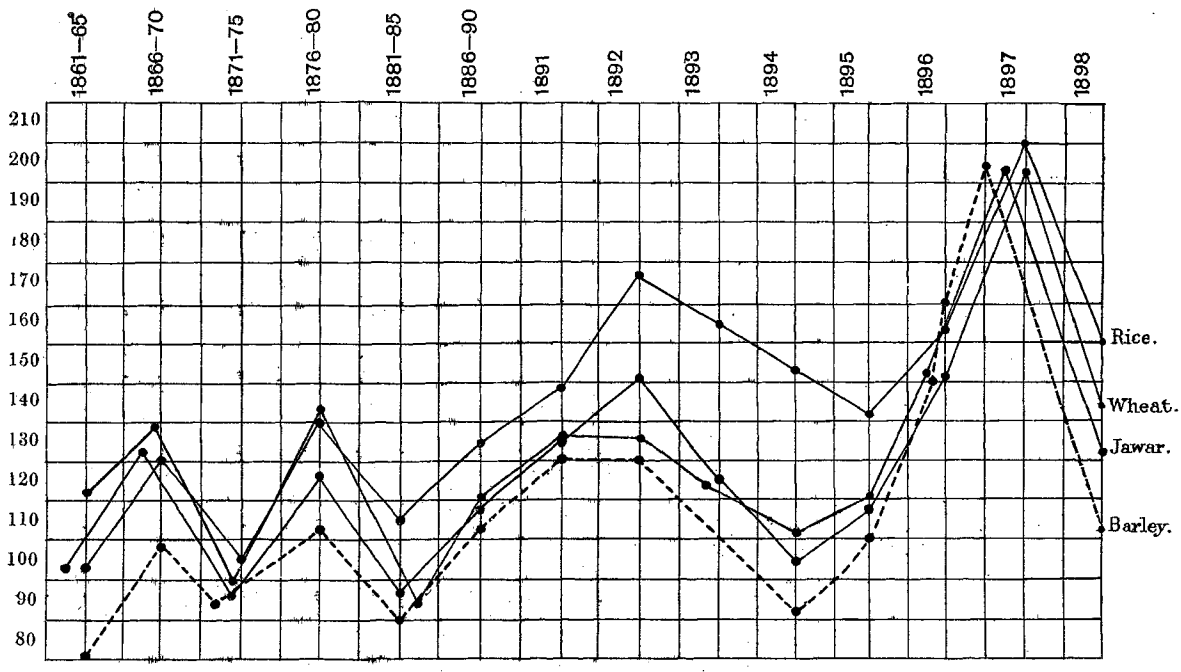
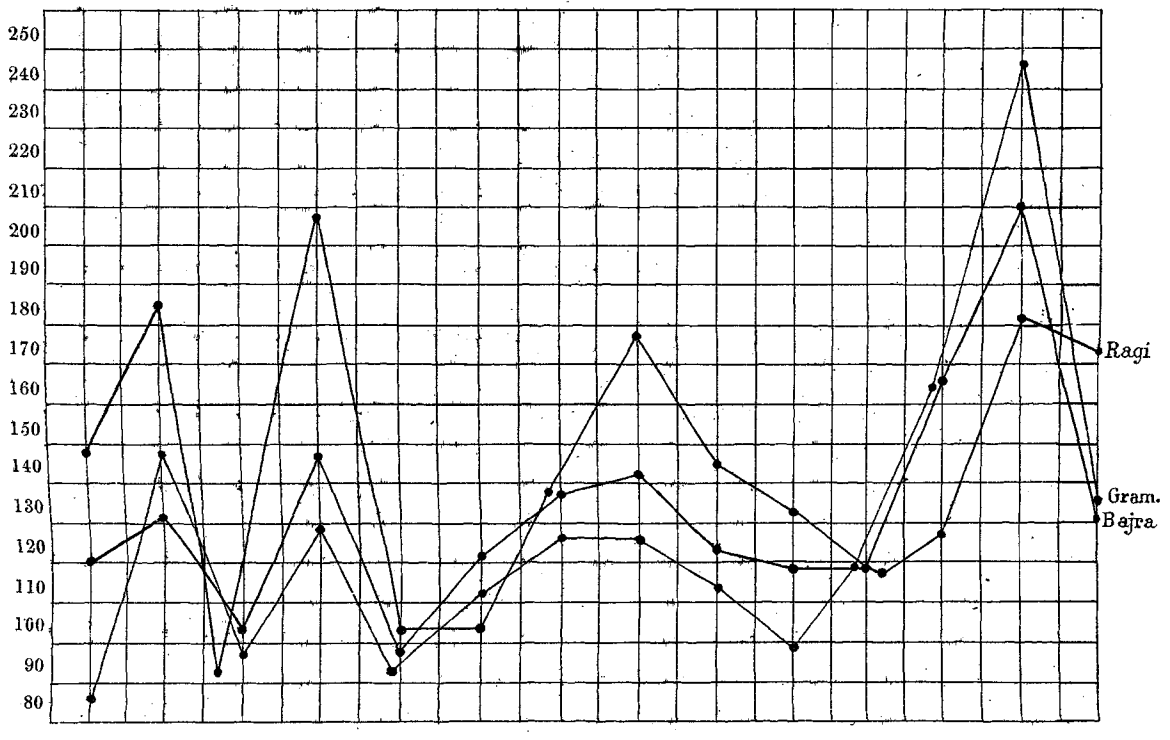
J. E. O'CONOR.

No. 38.

Diagram illustrating No. 37 (Variations in the Retail Price of Seven Food Grains).





NOTE.—The first quinquennium (1861–65) was normal.
The second „ (1866–70) included the great famine of 1866.
The third „ (1871–75) included the Behar famine of 1874 and a year of inflated prices [(1873).
The fourth „ (1876–80) included the great famine of 1877–78.
The remaining period until 1895 was normal.
The years 1896 and 1897 were years of intense famine.

There was but little indication of a *permanent* rise in prices until 1885. For nine years (a normal period) from 1885 prices continued on a comparatively high level. In 1894 and 1895 there was a tendency to a fall, which was checked by the failure of the harvests in 1896 and 1897.

1899–1900 (Budget Estimate).	27·642	8·76	6·00	5·78	4·89	4·65	3·95	1·95	0·46

NOTE.—The following additional taxation has been imposed since 1884, the approximate amounts of gross revenue realisable from each source being shown against each:—

	Rx.
I. Income Tax (including that in Burma)	1,800,000
II. Duty on Petroleum	155,000
III. Enhancement of Duty on Salt	1,600,000
IV. Increase of Duty on Imported Spirits	100,000
V. General Import Duties (including additional Duty on Petroleum and Duty on Silver)	1,600,000
VI. Import Duty on Cottons	900,000
VII. Increase of Kohat Salt Duty	50,000
VIII. Re-imposition of the Patwari Cess in the North-Western Provinces	200,000
Total	6,405,000

(1.) The income tax was imposed in 1886, replacing a provincial license tax, which yielded in the last year of its operation about a third of the yield of the income tax in the first year of its operation.

(2.) A duty was imposed in 1888 on imported petroleum, and the duty was doubled in 1894; non-illuminating petroleum, which had always been exempt, being also taxed at 5 per cent. in that year.

(3.) The salt duty was raised in 1888 in India from Rs. 2 to Rs. 2½, and in Burma from 3 annas to 1 rupee, per maund.

(4.) The rates of duty on imported spirit were raised in 1890.

(5.) An import duty of 6 annas per maund was levied on salted fish in 1893.

(6.) The import duties generally were abolished in 1882, only arms and ammunition, liquors, opium, and salt being retained on the list of dutiable imports. As stated above (4), the duty on spirit was raised in 1890, and in 1894 the whole of the customs duties taken off in 1882 were re-imposed, with the addition of a duty on silver.

(7.) The excise duties on spirit were raised when the duty on imported spirit was increased, and in every province additions have been made to the rates from time to time since. An excise duty has also been imposed on malt liquor.

(8.) The Patwari Cess in the North-Western Provinces was repealed in 1882, but was re-imposed in 1888.

(9.) No remissions or reductions of taxation can be noted as a set off against the taxation which has been imposed since 1886. The additional taxation would not have been necessary but for the fall in exchange.

* Besides the leaf and brick teas forwarded viâ Tientsin and Kiakhta to Siberia and Russia, considerable quantities are sent from Hankow and vicinity up the Han River to Fan-ch'êng, where overland carriage is resorted to. During the past 10 years the following quantities were thus forwarded to Siberia and Mongolia:—

Year.	Leaf.	Brick.	Stalk.	Dust.
	Lbs.	Lbs.	Lbs.	Lbs.
1888	30,981,200	1,743,200	—	—

1894	9,888,933	49,200	308,533	3,600
1895	1,799,600	5,382,666	574,933	76,933
1896	10,439,600	745,333	510,533	32,000
1897	7,518,000	1,213,733	768,533	91,466

† For the Exports in 1893, see Note on page 184.

No. 57—*continued.*

The TOTAL EXPORT of CHINA TEA direct to FOREIGN COUNTRIES for the past Ten Years is shown in the following table:—

Year.	Black.	Green.	Dust.	Brick.	Tablet.	Total.
	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.
1888	205,639,866	27,917,066	431,066	55,018,933	—	289,006,933
1889	180,873,866	25,643,466	1,385,333	41,357,066	1,051,066	250,310,800
1890	153,478,933	26,600,533	981,200	39,622,400	1,369,733	222,052,800
1891	160,485,466	27,568,000	470,800	43,848,133	965,466	233,337,866
1892	146,830,533	25,125,333	114,000	43,081,600	1,206,000	216,357,466
1893	158,694,133	31,498,266	169,733	50,981,466	1,433,866	242,777,466
1894	162,295,333	31,128,666	423,066	52,734,133	1,727,066	248,308,266
1895	149,860,260	32,560,266	42,666	64,185,600	2,108,533	248,757,333
1896	121,655,600	28,933,200	38,933	75,586,533	2,164,533	228,378,800
1897	101,988,666	26,822,400	217,066	74,439,733	819,866	204,287,733

NOTE.—The "Imperial Maritime Customs Trade Report" just issued for 1898 shows, approximately, an Export of Tea direct from China to foreign countries of 205 millions of pounds, against 204 millions in 1897.

The principal changes in destination comparing 1897 with 1898 are as follows:—

	Increase.	Decrease.
To Great Britain	—	6 million lbs.
Hong Kong	1 million lbs.	—
India	—	½ million lbs.
Australia	1 million lbs.	—
British America	½ ,,	—
U. S. of America	—	7 million lbs.
Continent of Europe, Russia excepted	⅓ million lbs.	—
Russia: Odessa, &c., by sea	6 ,,	—
Russia and Siberia, viâ Kiakhta	5 ,,	—
Russia, Manchuria	1 ,,	—
Cochin China, Tonkin, and Annam	½ ,,	—
By junk to Hong Kong	—	1 million lbs.
Totals	15½ millions	14½ millions.

INDIAN and CEYLON TEA in MARKETS outside the UNITED KINGDOM.

The following figures show the progress of Indian and Ceylon tea trade with Australasia, six years (in millions of lbs.):—

Imported.	1892.	1893.	1894.	1895.	1896.	1897.
Indian	3¾	6¼	4¾	6¾	6	6¾
Ceylon	5¼	7	7⅓	9¼	11	13¼
	9	13¼	12¼	16	17	20

The following figures show the transference from China tea to Indian and Ceylon in Australasia, three years (in millions of lbs.):—

Imported.	1895.	1896.	1897.
China	12⅜	7½	6
Indian	6⅜	6	6¾
Ceylon	9¼	11	13¼
	28¾	24½	26

The following figures show the progress of Indian and Ceylon tea trade with North America, six years (in millions of lbs.):—

Imported.	1892.	1893.	1894.	1895.	1896.	1897.
Indian	1½	2	2½	4	5¼	5¾
Ceylon	1½	2	2¼	3¾	4¼	5¾
	3	4	4¾	7¾	9¼	11½

The following figures show the total quantities of Indian and Ceylon tea taken by external markets, outside the home consumption of United Kingdom, five years (in millions of lbs.):—

Imported.	1893.	1894.	1895.	1896.	1897.
Indian	14	14	16¾	19¼	22
Ceylon	13	14½	20	23½	29
	27	28½	36¾	42½	51

Estimate for 1898 - 59 or 60 million lbs.

The following figures show the progressive movement of Indian and Ceylon teas re-exported from the United Kingdom to foreign parts, during ten months of 1896, 1897, 1898 (in millions of lbs.):—

	1896.	1897.	1898.
Of Indian tea	3	4¼	6
Of Ceylon tea	6½	8½	10
Of China and Java	16¾	17½	14¼
	26¼	30¼	30¼

The following figures show the percentages of the different kinds of tea (A) used at home, and (B) shipped abroad from the United Kingdom during the past seven years:—

	1891.	1892.	1893.	1894.
Used at home:				
Indian	48·75	53·00	51·00	54·50
Ceylon	25·00	30·50	30·00	33·50
China and Java	26·25	16·50	19·00	12·00
	100·00	100·00	100·00	100·00
Shipped abroad:				
Indian	10·00	9·90	9·80	11·00
Ceylon	6·40	9·45	12·20	16·40
China and Java	83·60	80·65	78·000	72·60
	100·00	100·00	100·00	100·00

	1895.	1896.	1897.
Used at home:			
Indian	52·50	53·85	53·60
Ceylon	33·50	35·25	36·90
China and Java	14·00	10·90	9·50
	100·00	100·00	100·00
Shipped abroad:			
Indian	13·20	12·90	15·10
Ceylon	23·30	24·70	28·70
China and Java	63·50	62·40	56·29
	100·00	100·00	100·00

REPORT OF THE INDIAN CURRENCY COMMITTEE, 1898.

To the Right Honourable Lord George Hamilton, M.P., Secretary of State for India.

India Office, 7th July, 1899.

1. In your letter of the 29th April 1898, your Lordship referred to us for consideration the proposals of the Government of India* for making effective the policy adopted by Her Majesty's Government in 1893 and initiated in June of that year by the closing of the Indian Mints to what is known as the free coinage of silver. That policy had for its declared object the establishment of a gold standard in India; and in inviting us to consider whether this object could best be attained by the specific measures proposed by the Goverment of India or otherwise, your Lordship indicated the scope of our inquiry in the following words† :—"It will be the duty of the Committee to deliberate "and report to me upon these proposals and upon any other matter which they may "regard as relevant thereto, including the monetary system now in force in India, "and the probable effect of any proposed changes upon the internal trade and taxation "of that country; and to submit any modifications of the proposals of the Indian "Government, or any suggestions of their own, which they may think advisable for "the establishment of a satisfactory system of currency in India, and for securing, as "far as is practicable, a stable exchange between that country and the United "Kingdom."

2. For the purposes of our inquiry we have held 43 meetings and examined 49 witnesses. The notes of evidence, together with statistical tables and other important information bearing on the subject of inquiry, have already been communicated to your Lordship‡; and we now proceed to report the conclusions which we have reached upon the questions referred to us.

I.

The Monetary System of India.

3. In order to explain the monetary system now in force in India, it is desirable to record certain salient facts of the history of Indian currency.

4. At the beginning of the present century no uniform measure of value existed in British India. Some parts of India (*e.g.* Madras) maintained a gold standard and currency; elsewhere, as in Bengal, a silver standard obtained, with gold coins in concurrent circulation; throughout India the coins, whether of gold or silver, differed in denomination and differed in intrinsic value even within the same district. Out of this confusion arose the demand for an uniform coinage, a demand to which the Court of Directors of the East India Company gave their approbation in the important Despatch on Indian currency addressed by them to the Governments of Bengal and Madras on 25th April 1806§. It is important to observe that the Directors, while "fully satisfied of the propriety of the silver rupee being the principal measure of value and the money of account," by no means desired to drive gold out of circulation. "It is not by any means our wish," they said, "to introduce a silver currency to the "exclusion of the gold, where the latter is the general measure of value, any more "than to force a gold coin where silver is the general measure of value." Nevertheless the first fruits of the policy of 1806 were seen in the substitution in 1818 of the silver rupee for the gold pagoda as the standard coin of the Madras Presidency, where gold coins had hitherto been the principal currency and money of account. In 1835, when the present silver rupee was formally established as the standard coin of the whole

* C.—8840, "Correspondence respecting the proposals on currency made by the Government of India."
† C.—9037, p. iii. ‡ C.—9037; C.—9222; C.—9376. § H. of C. No. 127 of 1898.

of British India, it was enacted that "no gold coin shall henceforward be a legal tender of payment in any of the territories of the East India Company."

5. But, though gold had ceased to be a legal tender in India as between private individuals, the coining of gold mohurs (or "15 rupee pieces") was authorised by the Act of 1835, and a Proclamation of 13th January 1841 authorised officers in charge of public treasuries "freely to receive these coins at the rates, until further orders, "respectively denoted by the denomination of the pieces." As the gold mohur and the silver rupee were of identical weight and fineness, this Proclamation represented a ratio of 15 to 1 between gold and silver. In 1852* it was held by the Directors of the East India Company, on representations from the Government of India, that the effect of this Proclamation "has been, and is likely to be still more, embarrassing" to the Government of India. "The extensive discoveries of gold in Australia having had "the effect of diminishing its value relatively to silver, holders of gold coin have "naturally availed themselves of the opportunity of obtaining at the Government "treasuries a larger price in silver than they could obtain in the market." Consequently, on 25th December 1852 there was issued a Notification† withdrawing the above provision of 1841, and declaring that, on and after 1st January 1853, "no gold coin will be "received on account of payments due, or in any way to be made, to the Government "in any public treasury within the territories of the East India Company."

6. In 1864,‡ the Bombay Association (representing the native mercantile community of Bombay) and the Chambers of Commerce of Bengal, Bombay and Madras having memorialised the Government of India for a gold currency, the Government proposed "that sovereigns and half-sovereigns, according to the British and Australian standard, "coined at any properly authorised Royal Mint in England, Australia, or India, should "be made legal tender throughout the British dominions in India, at the rate of one "sovereign for 10 rupees; and that the Government currency notes should be exchange-"able either for rupees or for sovereigns at the rate of a sovereign for 10 rupees, "but that they should not be exchangeable for bullion." The Imperial Government, while unwilling to make the sovereign a legal tender, saw "no objection to reverting "to a state of matters which prevailed in India for many years, namely, that gold "coin should be received into the public treasuries at a rate to be fixed by Government, "and publicly announced by Proclamation." It was considered that this experimental measure "will, as far as it goes, facilitate the use of the sovereign and half-"sovereign in all parts of India; it will pave the way for the use of a gold coinage "in whatever shape it may ultimately be found advisable to introduce it; and at "the same time, it establishes a preference in favour of the sovereign." Accordingly, on 23rd November 1864, a Notification was issued that sovereigns and half-sovereigns should, until further notice, be received as equivalent to 10 rupees and 5 rupees respectively, in payment of sums due to Government. In the following March, the directors of the Bank of Bengal§ urged that, "in view of the continued influx of sovereigns," the time had come when British gold might, "with safety and advantage, be declared legal tender at the respective rates of ten and five rupees," and the Government of India again pressed their original proposal on the Imperial Government. The Secretary of State replied on 17th May 1865, that the time did not appear to have arrived for taking any further step, nor did he see that any practical advantage would attend the proposal to admit British gold to legal tender in India. On 28th October 1868, the Government of India raised the rate for the receipt of sovereigns and half-sovereigns at the public treasuries from Rs. 10 and Rs. 5 to Rs. $10\frac{1}{4}$ and Rs. $5\frac{1}{8}$, respectively.

7. In 1876,‖ after the rupee had temporarily fallen in exchange to $18\frac{1}{2}d.$, the Bengal Chamber of Commerce and the Calcutta Trades' Association urged the temporary suspension of the compulsory coinage of silver by the Indian mints. The Government of India decided that "up to the present there is no sufficient ground for interfering with the standard of value."

8. In 1878,¶ however, the Government of India expressed a different opinion, being "led to the general conclusion that it will be practicable, without present injury to the "community as a whole, or risk of future difficulties, to adopt a gold standard while

---

* H. of C., No. 254 of 1860, p. 46. † H. of C., No. 152 of 1858. ‡ H. of C., No. 79 of 1865.
§ H. of C., No. 368 of 1865. ‖ H. of C. 449 of 1893. ¶ C.—4868 of 1886.

" retaining the present silver currency of India, and that we may thereby in the future " fully protect ourselves from the very real and serious dangers impending over us so " long as the present system is maintained." Aiming at the eventual adoption of the British standard, and the extension to India of the use of British gold coins, the Government proposed to proceed at the outset as follows: " We first take power to " receive British or British Indian gold coin in payment for any demands of the " Government, at rates to be fixed from time to time by the Government, till the " exchange " (about 1*s.* 7*d.* in 1878) " has settled itself sufficiently to enable us to fix " the rupee value in relation to the pound sterling permanently at 2*s.* Simultaneously " with this, the seignorage on the coinage of silver would be raised to such a rate as " would virtually make the cost of a rupee—to persons importing bullion—equal in " amount to the value given to the rupee in comparison with the gold coins above " spoken of. We should thus obtain a self-acting system under which silver would be " admitted for coinage at the fixed gold rate as the wants of the country required; " while a certain limited scope would be given for the introduction and use of gold " coin, so far as it was found convenient or profitable." The above proposals of 1878 were referred to a Departmental Committee, who, on 30th April 1879, briefly reported* that they were " unanimously of opinion that they cannot recommend them for the " sanction of Her Majesty's Government." A discussion of some of the reasons which appear to have influenced the Committee of 1879 in urging the rejection of the proposals referred to them will be found in the evidence given before us by Sir Robert Giffen, who was a member of that Committee. (*See* Questions 10,025–48.)

9. Between 1878 and 1892 the continued fall in the gold price of silver caused repeated embarrassment to the Government of India; but the main object of such attempts as were made by that Government to deal with the subject during the period in question was not to effect a change of standard in India, but to facilitate an international agreement which might cause a rise in the gold price of silver, and thus diminish the inconvenience resulting from the retention of a silver standard in India.

From INDIA CORPORATION LTD. 19, VICTORIA STREET, WESTMINSTER.

10. In 1881 Indian delegates were sent to the Monetary Conference at Paris, with instructions that " while the Secretary of State in Council is unwilling to encourage an " expectation of any material change at present in the monetary policy of India, he would " be ready to consider any measures . . . calculated to promote the re-establishment " of the value of silver."† In 1886, shortly before the appointment of the Royal Commission on Gold and Silver, the Government of India expressed the opinion that " the " interests of British India imperatively demand that a determined effort should be " made to settle the silver question by international agreement;"‡ and in 1892 Indian representatives were sent to the International Monetary Conference at Brussels, which was convened for the consideration of measures for the increased use of silver as currency.

11. In 1892, inasmuch as it was foreseen that the International Conference might fail to secure the objects for which it was to be called together, the idea of changing the standard of value in India from silver to gold had been once more brought into prominence by the action of the representatives of the mercantile community of Calcutta. On 18th February 1892,§ when the International Conference was in prospect, the Bengal Chamber of Commerce represented that it was " impossible for " men of business to feel any confidence in the future value of the rupee, and they " believe that such a state of things restricts the investment of capital in this country " and seriously hampers legitimate enterprise." If success could not be secured by International Agreement, the Chamber saw nothing " but the prospect of endless " fluctuations in the relative values of silver and gold, attended with a fall in the value " of silver of indefinite amount; and the Committee [of the Chamber of Commerce] " think that in such case the Government of India should take steps to have the " question of the advisability of introducing a gold standard into India carefully and " seriously considered by competent authorities." In their Despatch of 23rd March 1892, the Government of India, while urging the Secretary of State to lend his " support to any proposals that might be made by the United States of America, " or by any other country, for the settlement of the silver question by international " agreement," called attention to the probability that, failing an international

* C.—4868 of 1886, p. 26. † H. of C., No. 449 of 1881.
‡ C.—4868 of 1886. *See also* First Report of Gold and Silver Commission, pp. 353–9.
§ C.—7060, II. of 1893, p. 145 *et seqq.*

agreement, the United States would be forced to stop the purchase and coinage of silver; and they requested the Imperial Government, in view of this contingency, to take forthwith into consideration whether any, and, if so, what measures could be adopted for the protection of Indian interests. On 21st June 1892, the Government of India proceeded to record their "deliberate opinion that, if it becomes evident that the "International Conference is unlikely to arrive at a satisfactory conclusion, and if a "direct agreement between India and the United States is found to be unattainable, "the Government of India should at once close its mints to the free coinage of silver "and make arrangements for the introduction of a gold standard." In a telegram of 22nd January 1893,* the Government of India further explained their proposals, as follows:—"Our proposal is that we shall take power to issue a notification declaring "that English gold coins shall be legal tender in India at a rate of not less than "$13\frac{1}{3}$ rupees for one sovereign [*i.e.*, 18*d.* per rupee]. . . . An interval of time, of "which the length cannot be determined beforehand, should, we think, elapse between "the mints being closed and any attempt being made to coin gold in India. The "power to admit sovereigns as legal tender might be of use as a measure *ad interim*, "but it need not be put into force except in case of necessity."

12. The proposals of the Government of India were referred on 21st October 1892 by the Earl of Kimberley, then Secretary of State for India, to a Committee consisting of the late Lord Herschell, Lords Farrer and Welby, Mr. Leonard Courtney, Sir Arthur Godley, Lieut.-General Sir Richard Strachey, and the late Mr. Bertram Currie; and on 31st May 1893 (the Brussels Conference having meanwhile adjourned without arriving at any agreement), the Committee reported as follows:—†

"While conscious of the gravity of the suggestion, we cannot, in view of the serious evils with which the Government of India may at any time be confronted if matters are left as they are, advise your Lordship to overrule the proposals for the closing of the mints and the adoption of a gold standard, which that Government, with their responsibility and deep interest in the success of the measures suggested, have submitted to you.

"But we consider that the following modifications of these proposals are advisable. The closing of the mints against the free coinage of silver should be accompanied by an announcement that, though closed to the public, they will be used by Government for the coinage of rupees in exchange for gold at a ratio to be then fixed, say 1*s.* 4*d.* per rupee; and that at the Government treasuries gold will be received in satisfaction of public dues at the same ratio.

"We do not feel ourselves able to indicate any special time or contingency when action should be taken. It has been seen that the difficulties to be dealt with have become continually greater; that a deficit has been already created, and an increase of that deficit is threatened; that there are at the present moment peculiar grounds for apprehension; and that the apprehended dangers may become real with little notice. It may also happen that, if action is delayed until these are realised, and if no step is taken by the Indian Government to anticipate them, the difficulty of acting with effect will be made greater by the delay. It is obvious that nothing should be done prematurely or without full deliberation; but, having in view these considerations, we think that it should be in the discretion of the Government of India, with the approval of the Secretary of State in Council, to take the requisite steps, if and when it appears to them and to him neccessary to do so."

13. The Committee's recommendations having been approved by the Imperial and Indian Governments, there was passed, on 26th June 1893.‡ the Act, No. VIII. of 1893, "to amend the Indian Coinage Act, 1870, and the Indian Paper Currency Act, "1882." This Act provided for the closing of the Indian Mints to the "free coinage" of both gold and silver—Government retaining the power to coin silver rupees on its own account. By Notifications (Nos. 2662–4) of 26th June 1893, arrangements were made (i.) for the receipt of gold at the Indian Mints in exchange for rupees at a rate of 16*d.* per rupee, (ii.) for the receipt of sovereigns and half-sovereigns in payment of sums due to Government at the rate of Rs. 15 for a sovereign, and (iii.) for the issue of Currency Notes to the Comptroller-General in exchange either for British gold at the above rates or for gold bullion at a corresponding rate.

14. In 1897 the Secretary of State for India referred to the Government of India the question whether, if the Mints of France and the United States of

* C.—7060, II. of 1893, p. 183. † C.—7060 of 1893, p. 38. ‡ C.—7098 of 1893.

America were opened to the free coinage of silver as well as gold at a ratio of 15½ to 1, the Government of India would undertake to re-open concurrently the Indian Mints to the free coinage of silver and to repeal the above Notifications of 1893. In reply, the Government of India expressed their "unanimous and decided "opinion" that it would be "most unwise to re-open the Mints as part of the proposed "arrangements, especially at a time when we are to all appearance approaching the "attainment of stability in exchange by the operation of our own isolated and "independent action."* This conclusion was endorsed by the Secretary of State for India in Council and by the Imperial Government.

15. In January 1898, "in order to afford a means of relief to the severe stringency" then prevailing in the Indian money markets, an Act was passed (No. II. of 1898),† empowering the Government of India to direct, by Order notified in the Gazette of India, the issue of Currency Notes in India on the security of gold received in England by the Secretary of State at the rate and subject to the conditions to be fixed by such Order. Under this Act, which was to remain in force for six months, a Notification was published by the Government of India on the 21st January 1898, announcing that notes would be issued, in exchange for gold held by the Secretary of State for India, at the rate of one Government rupee for 7·53344 grains of fine gold, with the addition of such further quantity of fine gold as the Secretary of State should from time to time determine to be "sufficient to cover all costs and charges incidental to the "transmission of gold to India." Under this Notification, the Secretary of State in Council gave notice of his readiness "to sell, until further notice, telegraphic transfers "on Calcutta, Madras, and Bombay, at a rate not exceeding 1*s.* 4$\frac{5}{32}$*d.* for the rupee." This Act was extended for a further period of two years by the amending Act, No. VIII., of 1898. No gold has been tendered under the provisions of these Acts.

16. It will thus be observed that, at the present time, gold is not a legal tender in India, though the Government will receive it in the payment of public dues; that the rupee remains by law the only coin in which other than small payments can be made; that there is no legal relation between rupees and gold; but that the Indian Government has declared (until further notice) a rate at which rupees can be purchased for gold coin or bullion—such rate serving to determine the maximum limit to which the sterling exchange can rise under present arrangements.

II.

A. Silver Standard.

17. Having thus set forth the origin and present position of the monetary system of India, we proceed to consider the question whether, in the light of the six years' experience gained since 1893, it is desirable to reverse the policy initiated in that year and to re-open the Indian mints to the unrestricted coinage of silver. Such a step has not been advocated in the Memorials which we have received from the Chambers of Commerce of Bengal, Bombay, Madras and Karachi.‡ Nor is there unanimity among those who do advocate so important a change of policy. Apart altogether from the fact disclosed by the evidence that some who were opposed to the closing in 1893, now advocate a gold standard, there is a clearly marked division between those who would re-open the mints to silver forthwith and those who, while contemplating such a course eventually, hesitate to re-open the mints immediately. The latter class may be further subdivided into those who propose to leave the time and conditions of such re-opening to be hereafter determined, and those who suggest immediate steps towards a gradual re-opening. With regard to the last suggestion, which aims at mitigating what its advocates have represented to us as the prospects of disaster to merchants and traders and of grave difficulty to the Government of India from the sudden drop in exchange to the bullion value of the rupee (about 10½*d.* at the present time), no scheme has been submitted to us which appears likely to attain the object in view. In our opinion, any measures for gradual reopening would be so fully and immediately discounted as to defeat the precise objects for which they are suggested. It is obvious, moreover, that the

* C.—8667. † *See* Appendix, p. 34. ‡ *See* Appendix, p. 17 *et seqq.*

certain prospect of a heavy fall in the exchange would at once drive capital from India.

18. As regards the policy which, while declaring in favour of open mints, would leave it to future undefined circumstances to indicate when the step should be taken, this (so far as it is not dictated by the desire for an international agreement, to which we refer presently) recognises that, for the present, the benefits anticipated from a return to a silver standard do not counterbalance the evils which would result from abandoning the *status quo*. The hope apparently is that, from a rise in the gold-price of silver, or from a fall in the sterling exchange of the rupee, or from a combination of these or other undefined circumstances, it may hereafter become possible to revert to a silver standard without causing a sudden and heavy fall in the exchange value of the rupee. Meantime it is proposed that the present arrangements should continue indefinitely, in spite of the disabilities considered to be thereby imposed on what are regarded as the true interests of India. This suggestion could, of course, only be entertained by the Government of India if it were definitely decided, in principle, to re-open the Indian mints to silver; and its adoption or rejection must depend on the answer to the broad question with which we are about to deal, vizt.:—Is it desirable for India to revert to silver monometallism?

19. The policy of reopening the mints at some future date to silver stands on a different footing when urged by those who look forward to an international agreement and consider that there is reasonable hope of such an agreement within a limited period. Such persons, unlike those above referred to, aim directly at a stable exchange between India and the United Kingdom, and advocate delay only in order that an international agreement may be reached. With regard to this anticipation, we confine ourselves here to stating that, the negotiations of 1897 with France and the United States of America having proved fruitless, no fresh proposals, so far as we are aware, have been, or are being, made by any of the Governments concerned.

20. The main proposal that the Indian mints should be re-opened forthwith to the unrestricted coinage of silver has been supported by witnesses on various considerations, one of which is that "a low rupee and a low exchange" encourage the export trade on which India's prosperity depends, and that an "arbitrarily enhanced" rupee discourages exports. It is urged that encouragement would best be given to exports by a reversion to the system of open mints, so that the rupee in exchange would again coincide with the gold price of silver, with the result that an end would be put to the unfair advantage which the present system is held to give to the silver-using competitors of India, and which (according to this view) the effective establishment of a gold standard would perpetuate. Great stress is laid by the advocates of open mints upon the burthen imposed on the export trade of India by stringency in the Indian money market, which they attribute to the closing of the mints, and represent as likely to increase under the present system of closed mints. It is admitted generally by the advocates of open mints that the benefits which would accrue to India from restoring the silver standard would probably lead to difficulties on the part of the Indian Government; but it is urged that these difficulties would be temporary only, and that they could be met either by borrowing or by increased taxation, including import and export duties.

21. Dealing first with the question of discount rates, it will be sufficient to remark that the anticipations of increasing stringency have not been verified during the recent busy season. Whereas the minimum rate of the Bank of Bengal was 10 per cent. on 6th January 1898, rising on 24th February to 12 per cent. (at which figure it stood until 27th April 1898), and did not fall below 10 per cent. until 16th June 1898, the rate for the busy season of 1898–99 has never exceeded 7 per cent., and this though the total volume of India's seaborne foreign trade exceeded Rx. 210,000,000 in 1898–99, as against (under) Rx. 199,000,000 in 1897–98.

22. While it may be questioned whether banking arrangements in India might not with advantage be strengthened and adjusted to the growing requirements of Indian trade, we cannot doubt that one of the main causes of the stringency of 1897–98 was the reversal (necessitated by the exceptional circumstances of India at the time) of the relations of the Government of India and the money market in the autumn of 1897. In ordinary years the Government is able, through the sale of Council Bills and Telegraphic Transfers, to place large sums at the disposal of the money market

throughout the autumn and winter. Thus, during the last four months of 1894, the bills and transfers sold by the Secretary of State amounted to Rx. 8,052,000; in 1895, for the same period of the year, the amount was Rx. 9,888,000; in 1896 the amount was Rx. 6,056,900. But in 1897, owing to the depletion of the balances of the Government of India, brought about by expenditure on famine relief and military operations and by failing revenue, the Secretary of State was unable, from 1st September to 15th November, to offer bills or transfers for sale, and was compelled to purchase drafts on India for Rx. 1,000,000. Thus, during the last four months of 1897, the amount placed at the disposal of the Indian money market in the Presidency towns in consequence of the remittance transactions of the Government was only Rx. 332,700, or Rx. 5,724,200 less than the year before.

23. It must not be forgotten that high discount rates were not unknown in India under the system of open mints; for example, the Bank rate reached 12 per cent. in April 1890 (in which year the rate did not fall below 10 per cent. from 10th February to 24th April), while in 1889 12 per cent. was quoted continuously from 21st February to 28th March, the rate not falling below 10 per cent. from 17th January to 11th April of that year.

24. We come next to the suggestion that the present system of closed mints handicaps India in her industrial competition with countries on a silver standard.

Of such countries China may be taken as the type, and it is said that the greater fall in (say) the London exchange with China as compared with the fall in the exchange with India stimulates exports from China which compete with exports from India, and also stimulates native production in China to the disadvantage of Indian imports into China; and that in this way India is placed at a disadvantage, and that the disadvantage to India is increased when an actual rise occurs in the Indian exchange.

It is explained that a fall in the price of silver is necessarily accompanied by a fall in the China exchange, that the producer in China consequently receives a higher silver price in respect of the same gold price, whilst wages and the other factors in the cost of production do not increase in the same proportion; that production in China becomes more profitable and is therefore stimulated; that, on the other hand, if the Indian exchange does not fall to an equal degree, the Indian producer does not receive this stimulus, and, if the Indian exchange rises, the producer in that country receives a lower rupee price, while wages and the other factors in the cost of production do not proportionately diminish; that the Indian producer does not receive the same profit as before, and that production is therefore checked.

From INDIA CORPORATION, LTD. 19, VICTORIA STREET, WESTMINSTER, LONDON, S.W.

This aspect of the question was considered by Lord Herschell's Committee, and the conclusions at which they arrived will be found in paragraph 27 of their Report. They expressed the opinion that, even if we assume the argument as to a stimulus or check to production to be sound, the effect of each successive fall in exchange must be transitory, and could only continue until circumstances have brought about the inevitable adjustment. In this opinion we concur, and evidence has been laid before us which shows that prices and wages have risen in China since silver has fallen in price and the local copper currency has appreciated in terms of silver.

25. Lord Herschell's Committee examined the statistics of Indian exports for a series of years, and came to the conclusion that "although one may be inclined, "regarding the matter theoretically, to accept the proposition that the suggested "stimulus would be the result of a falling exchange, an examination of the statistics "of exported produce" [from India] "does not appear to afford any substantial foun- "dation for the view that in practice this stimulus, assuming it to have existed, has "had any prevailing effect on the course of trade; on the contrary, the progress of "the export trade has been less with a rapidly falling than with a steady exchange."

We need not quote the statistics of the export trade to which that Committee called attention, but we desire to state that we have been unable to find any statistical support for the theory that exports are largely and permanently stimulated by a depreciation of the standard of value, resulting in a fall in the exchange.

The statistics of the Indian export trade since the mints were closed to silver might have been expected to throw light on this portion of the question, but their value for this purpose is much diminished by the special disturbing influences to which that trade has been subjected during the last six years.

The closing of the Indian mints, the cessation of the purchases of silver by the United States of America, the consequent fall in the price of silver, and the apprehension to which it gave rise, undoubtedly disturbed the course of trade for a time, and when

recovery to more normal conditions might have been expected, India was affected by war, famine, and plague, and its finances were so seriously embarrassed that the drawings of the Secretary of State were largely reduced, and loans of unusual magnitude were raised in London on account of the Government of India. The exports from India were largely reduced in 1897–98. In the following year (1898–99) there was a marked recovery; the drawings by the Secretary of State were unusually large; and a substantial sum in gold was brought to the Indian Treasury.

26. For convenience of reference we give in this place the figures of gross exports from India in the 12 years from 1887–88 to 1898–99.

Year.	Exchange.	Silver, per oz.	Exports of Merchandise.	Year.	Exchange.	Silver, per oz.	Exports of Merchandise.
	d.	*d.*	Rx. (000 omitted).		*d.*	*d.*	Rx. (000 omitted).
1887–88 -	16·898	$44\frac{5}{8}$	90,471	1893–94 -	14·547	$35\frac{5}{16}$	106,448
1888–89 -	16·379	$42\frac{7}{8}$	96,978	1894–95 -	13·101	$28\frac{15}{16}$	108,815
1889–90 -	16·566	$42\frac{11}{16}$	103,397	1895–96 -	13·638	$29\frac{7}{8}$	114,263
1890–91 -	18·089	$47\frac{11}{16}$	100,136	1896–97* -	14·451	$30\frac{3}{4}$	103,914
1891–92 -	16·733	$45\frac{1}{16}$	108,036	1897–98* -	15·354	$27\frac{9}{16}$	97,537
1892–93 -	14·985	$39\frac{13}{16}$	106,536	1898–99 -	15·978	$26\frac{15}{16}$	112,723

* Famine years.

For the reasons we have stated in the preceding paragraph, we hesitate to draw any positive conclusion from these figures, but they afford no support to the theory that large exports are incompatible with a rise in the rate of exchange.

27. In this connexion we wish specially to notice the very important Tea Industry of India and Ceylon, which certain witnesses stated to be seriously threatened by competition with China tea produced in a country on a silver basis. We recognise the large capital invested in the tea estates, and that their maintenance is of vital importance to the many Europeans and natives employed therein. It was represented to us that the profits of the producers of Indian and Ceylon tea had been affected by the recent rise in the Indian exchange; that although this diminution of profit could not immediately affect the total export of tea from gardens already in existence, or the increase from gardens in process of formation and about to come into bearing, it would tend to diminish the extension of cultivation, and thus prevent the export of tea from increasing to the extent to which it would otherwise have done.

We do not doubt that the recent rise in the Indian exchange temporarily diminished the profits of the producers of tea, just as the previous fall had temporarily increased them; but, as we have already said, we see no reason to suppose that the strength of the competition of China tea will be permanently increased by the fact that China is on a silver basis. So far there is no evidence to show that the exports of China tea have appreciably increased, and there is evidence to show that the rise in Chinese wages and general prices has at least begun to take effect.

It appears to us that the permanent interests of the tea gardens of Ceylon and India will be promoted rather than injured when their operations are carried on under the same standard of value as exists in the countries to which their produce is exported.

We find that this question of the competition of China with Indian tea was specially considered by the Government of India in 1892, before the Indian mints were closed to silver, in connexion with a memorial on the subject from the Darjiling Planters' Association. The views of the Government of India on the subject are contained in a letter to the Honorary Secretary to the Association, dated 12th October 1892, and printed at pp. 176–77 of the Minutes of Evidence before Lord Herschell's Committee. The following extract from that letter contains a summary of the views which the Government of India expressed at that time:—

"To sum up, the Government of India are of opinion—

"(1.) That a country, as a whole, makes no gain in its international trade by a depreciation of its standard, since the extra price received for its exports is balanced by the extra price paid for its imports.

" (2.) That the producer of an article of export may make a temporary and unfair gain from depreciation of the standard, at the expense of his employés and of other persons to whom he makes fixed payments.

" (3.) But that this gain, while not permanent, is counterbalanced by a tendency to over-production and consequent reaction and depression, by a liability to sudden falls in price as well as to rises, and by the check to the general increase of international trade which necessarily results from the want of a common standard of value between countries which have intimate commercial and financial relations."

We are unable to find that anything has occurred since the closing of the Indian mints to silver to throw doubt on the soundness of the views expressed in 1892 by the Government of India.

28. As regards the argument that a low exchange stimulates exports and discourages imports, it is further to be observed that whatever advantages attach to a low exchange should be increased, by parity of reasoning, by a still lower exchange; and it has accordingly been represented to us that it is a falling exchange which stimulates exports. But, as regards the ultimate limits of beneficial fall, we have failed to discover at what precise point, if at all, the advocates of this view would hold that the alleged advantages of a falling exchange cease.

29. To re-open the Indian Mints to silver without an international agreement would necessarily result, according to all past experience, in renewed instability of the exchanges between India and gold-standard countries. It is generally recognized that fluctuations of exchange constitute an obstacle to international trade, the true interests of which are to be sought in a stable monetary par of exchange. Since over four-fifths of India's seaborne foreign trade is with gold-standard countries, it follows that the balance of advantage is heavily in favour of stability of exchange with gold-standard countries; and accordingly, considered by itself, the instability of exchange which must be anticipated from re-opening the Indian Mints to silver, is a powerful argument against taking the step.

From INDIA OFFICE LIBRARY, 19 VICTORIA STREET, WESTMINSTER, LONDON, S.W.

30. So far we have considered the matter solely from the standpoint of trade; and the above remarks will have indicated our conclusion that, even apart from considerations primarily affecting the Government of India, it is not in the permanent interests of India that her foreign commerce, over 80 per cent. of which is with gold-standard countries, should be hampered by the restoration of silver monometallism. This conclusion is strengthened by considerations affecting the Government of India, which is the representative of the general interests of India. Apart from certain large payments in India (such as the pay of British soldiers serving in that country), the rupee total of which payments is regulated by the sterling exchange, the Secretary of State for India has now, under normal conditions, to meet obligations in England amounting annually to between 17 and 18 millions sterling. In order to make these payments, the Government of India raises taxation in rupees, and would therefore be seriously affected by the re-opening of the mints to silver. It is impossible to foretell what would be the actual effects of this step on exchange. But a drop even to 1*s.* (which is about 2*d.* above the present bullion value of the rupee) would, on a moderate estimate, increase the necessities of the Government of India by at least Rx. 10,000,000 gross, against which might be set some possible increase of revenue, leaving an increase of at least Rx. 7,000,000. This sum exceeds the total excise revenue of India by Rx. 1,500,000, exceeds the total stamp revenue by Rx. 2,160,000, and is nearly four times the total yield of the Indian income tax. An increase of expenditure to this extent would not only absorb the whole of the present surplus—which is the result of an increase in taxation imposed since 1886 principally to meet exchange difficulties—but would also necessitate further taxation. As regards an increase of taxation, Lord Northbrook has expressed the opinion (Q. 8,407) that, while it would be possible, " it would be in the highest degree " unwise, both in respect of the trade of India, the welfare of the people of India, " and I will go far as to say the security of the Indian Empire." Concurring as we do in this opinion, which has been supported by the independent testimony of other distinguished administrators of India, we must add that the Government of India

would not be justified in assuming that, with the mints re-opened to silver, the fall of the exchange to a shilling is the greatest fall which they might be called upon to face either immediately or at a future time.

31. It has been urged before us that, so long as the rupee is current at a value considerably above that of the silver which it contains, there is serious risk of counterfeit coins in silver of standard fineness being manufactured and put into circulation. This subject has engaged the attention of the Government of India; and in a despatch dated 12th January 1899 (more than five and a half years after the closing of the mints), they express the opinion that there is no evidence of such counterfeiting on any appreciable scale. We see no reason to doubt the correctness of that opinion; nor does the experience of other countries, in which silver coins circulate at an enhanced value, suggest any other conclusion.

32. In view of the considerations which we have stated, we concur with the Government of India in their decision "not to revert to the silver standard."

III.

The Principle of a Gold Standard.

33. At the present time, the practical alternative to silver monometallism is a gold standard, that is to say, gold as the measure of value in India, either with a gold currency or with a gold reserve.

34. We have already referred to the fact that over four-fifths of the foreign trade of India is with gold-standard countries, and that for this reason it is desirable that India should have the same measure of value as those countries. Regard being had to the supremacy of gold in international commerce, the change to a gold basis has been represented to us by Professor Marshall (Q. 11,815) as "like a movement towards "bringing the railway gauge on the side branches of the world's railways into unison "with the main lines." This consideration directly relates to facilitating interchange of commodities.

35. A further and certainly not a less important consideration for a country like India is that an established gold standard is the simplest and most effective means of attracting capital. The need of India for foreign capital is indisputable, and this need is partly of a temporary and partly of a permanent character. For climatic reasons, India is essentially a country of seasonal trade; she has a busy season and a dull season, though the tendency of late years has been to diminish the disparity and to exhibit approximation to a more uniform average within each year. From this seasonal character it follows that the demand for money is much greater for one part of the year than for the other. In the busy season there is a brisk demand for temporary advances to move the crops; in the dull season money is in little demand. The distinction is shown in an extreme form by the facts of the money market in 1897–8, when there was a seasonal variation in discount rates of no less than 7 per cent., and the fluctuations were even greater in 1889 and 1890. In order to diminish the risk to Indian commerce of a recurrence of such stringency, and in order to reduce the average rate charged for the local use of money, the sound policy is to attract capital to India from the gold-standard countries which have capital to lend, and this can best be achieved by a gold standard and a stable exchange. Moreover, it is in many ways as important that money should be able to flow out of a country without depreciation, when it is no longer in relative demand there, as that it should flow in when required. A gold standard is, in our opinion, the only means by which, under present conditions, these benefits can be secured.

36. The natural resources of India are beyond question, as also is the need for their development. In order to develope and reap the benefit of her resources, India requires, and must long continue to require, foreign capital. Such foreign capital can only be drawn from the gold-standard countries; and the capital of these countries can only be attracted by a moderate rate of interest or profit on condition that the investor is satisfied that there is not likely to be a fall in the

sterling exchange. We have had the valuable testimony of Mr. Alfred de Rothschild (Q. 11,853) that British capital would be at once forthcoming if the British investor knew that there was a fixed rate of exchange between the two countries. We attach great importance to this argument in favour of a gold standard for India.

37. It seems unnecessary to discuss the further considerations which point to the benefits to India of a gold standard. We desire, however, to remark that the effective establishment of such a standard in India would not preclude India hereafter from considering responsible proposals for an international agreement, if circumstances should arise to render such negotiations practicable.

38. Before discussing the various further measures which have been proposed for establishing a gold standard in India, we submit to your Lordship the following considerations relating to the existing currency arrangements. Inasmuch as, for practical purposes, the sterling exchange furnishes a broad test of a country's claim to be on a gold standard, and inasmuch as the Indian exchange since January 1898 has been stable (within what may be regarded as "specie points") at 16*d.* per rupee, it has been represented to us that the gold standard may be regarded as having been reached in India already. According to this view, the closing of the Indian mints to silver and the undertaking by the Government to give rupees for gold has already had the result of making gold practically a legal tender in India, present arrangements being sufficient to supplement automatically from time to time the stock of currency.

From
INDIA CORPORATION, LT
19, VICTORIA STREET,
WESTMINSTER,
LONDON,

39. Judged solely by existing facts, this contention cannot be disputed in its essentials. Events have proved more favourable than was anticipated by the Government of India when, in their despatch of 3rd March 1898, they represented that it was not very probable that gold would be presented in the early future. And, although they expressed the opinion that it was "in any case extremely unlikely to be "presented in such quantity as to lead automatically to an accumulation of gold "sufficient for a reserve," statistics indicate that a considerable accumulation has already been effected. On 31st March 1899, the reserve of the Paper Currency Department of the Government of India included gold to the amount of over 2,000,000*l.* sterling. At the present time the amount of gold is 2,378,609*l.*

40. While this substantial addition in gold was being made to the Indian currency, the Government of India was able, within the year to 31st March 1899, to remit by the sale of Council Bills a sum of 18,712,454*l.*, which is considerably more than the average sterling requirements of the Secretary of State, and was 2,712,454*l.* in excess of the original estimate of his sterling drawings. This has been accomplished without lowering the average price realised by the sale of Council Bills below 15·978*d.* (or as nearly as possible the limit fixed in 1893); and stringency has not recurred in the Indian money-market. Automatically, therefore, existing currency arrangements sufficed not only to maintain—without monetary stringency—a steady gold standard in 1898–9, but also to initiate a gold reserve in India, to serve as a bulwark for the maintenance of the gold standard in future years.

41. If it has been possible to secure these results in the past in the face of distrust, it may be argued that even greater success may be expected in the future with the growth of confidence. We are by no means prepared to suggest that this may not prove the case, or that the mere continuance of the *status quo* may not prove adequate by itself gradually to supplement the currency of India with a margin of gold sufficient to tide her over adverse years hereafter. But the same considerations which tell in favour of maintaining the *status quo* for the present, equally tell against its maintenance permanently. In practice it would be impossible for the Government of India to receive gold beyond a certain point into their Treasuries or their Paper Currency reserve, unless they were also empowered to pay that gold out again in cashing their notes or meeting other liabilities in India. But this would mean declaring gold a legal tender at a fixed rate, and thereby superseding the purely provisional machinery of the existing system. According to this argument, therefore, maintenance of the existing system comes to mean little more than postponing further action for a time. The interval would be long or short, according to the slow or rapid accumulation of gold; but in no case could the provisional arrangements now in force constitute—nor indeed, were they

ever intended to constitute—a permanent settlement of the problem. The practical question is, therefore, narrowed to this :—Should the *status quo* be allowed to continue until events force the Government to take action? There would have been more to be said in favour of suspending action and leaving facts to settle the problem, had it not been for the circumstances which led the Government of India to formulate proposals for curtailing the transition period and taking "active steps to secure the early establishment of a gold standard and a stable exchange." That opinion having been expressed by the Government of India, and public discussion having been aroused by the publication of their proposals and by the present inquiry, it appears to us undesirable, even though results have proved more immediately successful than the Government of India anticipated on 3rd March 1898, to leave matters as they are. If, in face of the public attention which the question has attracted, and in face of the considerable divergence of the views expressed on the subject, no further steps were now to be taken, an additional uncertainty would be caused; doubts would be excited as to the ultimate success of the gold standard; rumours would arise of a possible change of currency policy; the Government both in India and at home would be pressed for a final pronouncement, alike by the friends and by the foes of a gold standard; and meantime the material interests of India would suffer from the withdrawal of confidence in her monetary future.

For these reasons we conclude that steps should be taken to avoid all possibility of doubt as to the determination not to revert to a silver standard, but to proceed with measures for the effective establishment of a gold standard.

IV.

The Indian Government's Proposals.

42. Having thus expressed our agreement in the objects which the Government of India have in view, we pass to the consideration of the specific measures proposed by them with a view to making effective the monetary policy adopted by Her Majesty's Government in 1893 and initiated by the closing of the Indian Mints to the unrestricted coinage of silver.

43. The proposals of the Indian Government were contained in their despatch of 3rd March 1898, and have been explained to us by official witnesses. They may be summarised as follows :—

In order to keep the exchange value of the rupee at a steady level of 16*d.*, it was deemed necessary to decrease the rupee circulation so as to remove the relative redundancy. The amount to be so withdrawn could not be foretold with exactness, but it was more than probable that it would fall short of Rx. 24,000,000. Within this outside limit it was proposed "to melt down existing rupees, having first provided a reserve of gold, "both for the practical purpose of taking the place of the silver, and in order to "establish confidence in the issue of our measures." The first step was to take powers to borrow sums not exceeding in the whole 20,000,000*l.*, and at once to remit 5,000,000*l.* in sovereigns to India as a first instalment. If exchange remained at or above 16*d.*, there would be no further step [Q. 2653]. But if, and so long as, the exchange fell below 16*d.* [Q. 2657–8], the Government of India would take rupees from its balances, melt them down, sell the bullion for other rupees in India (at an assumed loss of 40 per cent.), pay these other rupees into its balances, and finally make good thereto the 40 per cent. balance of loss with part of the borrowed gold. It was anticipated [Q. 2663] that one borrowing (5,000,000*l.*) might be sufficient, that sum approximately covering the assumed loss to Government of Rx. 8,000,000 on melting down Rx. 20,000,000. As a result, it was anticipated that by the automatic operations of trade, gold would flow into the country and remain in the circulation. But until the exchange value of the rupee was established at 16*d.*, and sovereigns became, to some extent however small, a permanent part of the circulation, it was not the Government's intention to part with any of the gold in their possession. Meantime, gold was not to be made a legal tender in India, though the Government looked forward to this as a future goal.

44. The proposals of the Government of India were based on the belief that the rise in the value of the rupee, and in the exchange with London, subsequent to the year 1894–5, was due to a contraction of the Indian currency relative to the demands of trade, that this cause would continue to operate so long as the Indian Mints were closed to silver, and that, if only that stage of distrust could be passed, "which

" appears the moment exchange approximates to sixteen pence to bring into operation " influences which interfere with the actual realisation of that rate," the exchange, under normal conditions of trade, might be expected " to attain the level at which gold " would be tendered under the notification of 26th June 1893, and the introduction of " the gold standard would become practicable."

They were anxious " both in the interests of the State and of the mercantile community to terminate the period of transition without further delay,"—in the interests of the State, because it would be cheaper in the end to acquire a reserve of gold by borrowing, and thus keep the exchange value of the rupee at a steady level of sixteen pence than to bear for years the burden of expenditure entailed by the lower level of the rupee; in the interests of the commercial community, because it was not desirable that their legitimate business should be hampered and embarrassed by the uncertainty of exchange, while the want of confidence in the stability of the rupee discouraged the investment of capital in India, and available capital was remitted to England whenever the exchange value of the rupee rose to a high level.

The proposals of the Government of India were made in March 1898, and since that date there has been a marked improvement in the position. The exchange has been steady at or about 1*s.* 4*d.*, the drawings of the Secretary of State have been unusually large, and a substantial sum of over 2,370,000*l.* in gold has been brought to the Indian Treasury; in other words, what the Government of India described as the " stage of distrust," which interfered with the actual realisation of a rate of sixteen pence, has been already passed.

If the Government of India could have foreseen the course of events in the past year, it is possible that their recommendations might not have taken the precise form in which they were put forward; and we are informed that, even if their proposals had been sanctioned at once, they would not under the conditions that have since prevailed have given effect to that portion of their scheme which provided for the withdrawal of rupees from the Indian currency. However that may be, we think it desirable that the proposals of the Government of India should, even under the altered conditions of the present day, be carefully considered by us.

From INDIA CORPORATION, 19 VICTORIA STREET WESTMINSTER LONDON

45. In the first place we desire to point out that it has not been proved that the rise in the value of the rupee since 1894–5 is due solely to relative contraction of the Indian currency; and it may be that it is not due mainly to this cause. It is not certain that there has been any contraction of the Indian currency which has materially affected the exchange, though it may not unreasonably be inferred that there must have been some contraction, and that such contraction has had some influence on the exchange value of the rupee. On the other hand, there are causes other than contraction of the currency which affect the value of the rupee and the exchange with London. Large borrowing in London on account of India, reduction of the drawings of the Secretary of State, an increase in the exports from India unaccompanied by an equivalent increase in imports, as well as a general rise in gold prices, would all affect the rate of exchange with India, though it is quite impossible to estimate the relative importance of these factors among themselves, or the amount of their influence on exchange as compared with the effect of a contraction of the currency, or to state the precise degree of influence which any, or all of them, have had on any particular alteration in the exchange. Nor, on the other hand, is it certain that the unusually low rate of exchange that prevailed in 1894–5 was due solely to a relative redundancy of the Indian currency. The closing of the Indian Mints necessarily brought into play many disturbing influences which may have affected 1894–5.

Since the mints were closed there has also been large borrowing on Indian account, and there have been, in some years, large reductions below the normal amount in the public remittances from India, while fluctuations have been experienced in the foreign trade of India, due to famine and plague as well as to other causes. All these causes must at different times have affected the exchange either favourably or unfavourably.

Another influence which must have had a favourable effect on the Indian Exchange is the reduction in the imports of silver due to the closing of the mints. The average yearly net import in the three years preceding the closing of the mints was 43,133,678 ozs., of the value of Rx. 12,020,296; and, for the three years ending 1898-9, the average net import was 31,126,376 oz., of the value of Rx. 6,103,431.

46. In face of the facts we have just stated, we are unable to accept, without qualification, the opinion that the rise in the value of the rupee since 1894–5 has been due, wholly or mainly, to a relative contraction of the Indian currency. We are

not prepared to say that the contraction of the Indian currency has not been an important factor in the rise in the Indian exchange; but, so long as the facts of the case are surrounded by so much obscurity, we consider that it would be unsafe to base action of so drastic a character on this assumption.

If it be the case that the rise in the value of the rupee since 1894–5 is not due, wholly or mainly, to the relative contraction of the Indian currency, it follows that an additional contraction of that currency, produced artificially by the withdrawal of rupees in the way proposed by the Government of India, might not have so much effect in strengthening exchange as the Government of India believed; and, though we accept in principle the proposition that a reduction in the number of rupees tends to increase the value of the rupee, we are not prepared to admit that such effect must necessarily be direct and immediate; nor are we satisfied that such reduction, carried out on a large scale and within a limited period, might not aggravate, if it did not produce, a period of stringency in the Indian money market.

47. So far as the proposals of the Government of India were intended to secure the confidence of the commercial community, they have failed in their effect; these proposals have not been supported before us by the representatives of the commercial and financial interests connected with India, nor, indeed, by any of the independent witnesses whom we have examined. The commercial classes of India appear to have feared that the withdrawal of rupees from the currency would inevitably aggravate or produce stringency in the Indian money market, and that the sale of silver by the Indian Government would lower the price of that metal, and disturb the exchanges with China and other countries on a silver basis.

The argument of the Government of India that the adoption of their proposals would involve less loss to the Indian Exchequer than the maintenance of the *status quo*, does not appear to us to possess much force. If the principle on which they based their proposals was sound, namely, that the rise in exchange was due to the contraction of the Indian currency, and that the same cause would continue to act in the same direction so long as the Indian mints were closed to silver, there was no likelihood of any serious fall in exchange, and, consequently, no prospect of any considerable increase of expenditure on this account. If, on the other hand, the basis of their proposals was unsound, it was not certain that they would have produced the desired effect, and, while a considerable expenditure would have been incurred in borrowing in gold and withdrawing rupees from the currency, the operation might not have resulted in any material reduction in the charge for exchange.

Although we sympathise with the Government of India in their desire to shorten the period of transition, to inspire confidence in the commercial community, and to remove an impediment to the flow of British capital to India, and recognise the force of the pressure upon them in the beginning of 1898 to take immediate steps in a direction which, it was hoped, would lead to the desired result, we can only say that, for the reasons already stated, we do not approve of their proposals, and cannot recommend their adoption.

V.

A Gold Currency.

48. It is of greater practical importance at the present time to consider what steps the Government of India contemplated taking when, by their methods, that state of things had been established which is in actual operation to-day. They did not definitely propose to make gold coins a legal tender; but they did not hesitate to express the opinion that "the only state of things which can be called a thoroughly satisfactory "attainment of a gold standard is one in which the gold coins which represent our "standard are those also which are good for payments in England." As a matter of principle, therefore, the Government of India favoured a gold standard *with* a gold currency.

49. This brings us to the consideration of schemes which have been proposed for establishing a gold standard *without* a gold currency. Great stress has been laid upon the hoarding habits of the natives of India; and, in view of the direct encouragement which a gold currency might give to the hoarding of gold, it has been represented to us by Mr. Lesley Probyn that, "if gold coins were passed into the currency, it would be at first almost like pouring water into a sieve." He accordingly proposed (i.) to institute a separate issue of gold notes of the denomination of Rs. 10,000; (ii.) to issue such notes only in exchange for gold; (iii.) to

make them payable (at the option of the holder) either in rupees or in gold: (iv.) to make it optional to the Currency Department, when gold is demanded, to pay either in sovereigns or in gold bars of not less than 67*l*. It was hoped that gold would be attracted to India, and that a gold reserve would be gradually accumulated which would be strong enough to allow the Government to undertake ultimately the universal convertibility into gold of all rupees and rupee-notes, when presented in parcels of not less than Rs. 10,000. Under this scheme the gold standard would be left to automatic agencies to establish, and its establishment would coincide with an ultimate undertaking to exchange rupee currency for gold bars of high value.

50. On this scheme we remark that, while bullion may be regarded as the international medium of exchange, there is no precedent for its permanent adoption for purposes of internal currency; nor does it accord with either European or Indian usage that the standard metal should not pass from hand to hand in the convenient form of current coin. No real support for such a scheme is to be drawn from the purely temporary provisions of "Peel's Act" of 1819, whereby, for a limited period, the Bank of England, as a first step to the resumption of cash payments, was authorised to cash, in stamped gold bars, its notes, when presented in parcels of over 200*l*. Little or no demand for gold bullion appear to have been made on the Bank under these temporary provisions, which were repealed at the instance of the Bank itself in 1821.

From INDIA CORPORATION, LTD. 19 VICTORIA STREET WESTMINSTER LONDON

As regards the hoarding difficulty in India, we are not satisfied that the danger therefrom is so great as has been suggested. There is little or no likelihood, even according to the most sanguine view, that for a long time to come gold coins, even if declared a legal tender forthwith, would find their way to any great extent into general circulation. Even under silver monometallism India imported and absorbed gold, as she is doing to-day, and as she may be expected to do in the future, no matter what her system of currency. In a strongly conservative country like India no sudden changes are to be expected in the habits and customs of the people, particularly in matters relating to currency and hoarding; but, while we must look to the continuance of the habit of hoarding, we may also feel satisfied that, until gold has penetrated into general circulation (so far as the relatively small transactions of India permit), there will be no materially increased temptation to the natives of India to hoard gold instead of silver. Moreover, the introduction of a gold currency into India would not be an untried experiment. As has been shown above, gold coins were in common circulation in India generally within living memory, and were expressly stated in 1806 to form the principal currency and money of account of Madras. If hoarding did not render a gold circulation an impossibility in the past, we look for no such result in the future.

51. Consequently, we are of opinion that the habit of hoarding does not present such practical difficulties as to justify a permanent refusal to allow India to possess the normal accompaniment of a gold standard, namely, a gold currency.

52. Another plan for establishing a gold standard in India without a gold currency, was submitted and explained with great ability by Mr. A. M. Lindsay. In order to fix the sterling exchange, he proposed to make the rupee currency freely convertible in India at a fixed rate into drafts on a sterling fund located in London. At the same time rupee drafts were to be sold at a fixed rate in London. Assuming a par of 16*d*., sterling in London was to be convertible into rupees in India at $16\frac{1}{16}d$., and rupees in India were to be convertible into sterling in London at $15\frac{3}{4}d$.; drafts were to be sold both in India and in London to any extent; but the amount in each case was to be not less than Rs. 15,000 and 1,000*l*., respectively. In order to provide for meeting the sterling drafts, a loan not exceeding 10,000,000*l*. was to be raised in London, while, so far as the available stock of rupees proved insufficient, silver would be purchased (also out of the loan) and sent to India to be there coined into rupees. If an excess of rupees accumulated as the result of selling sterling drafts, it might be necessary to sell the excess as bullion and credit the proceeds to the sterling fund. Under the scheme, rupees would continue to form the circulating medium of India, gold not being admitted to legal tender. While Mr. Lindsay held that such a system of currency would answer all purposes and be economical, and might, therefore, be permanently adopted, he considered [Q. 4303-4] that his scheme would be the best means of leading up to a gold currency, if this were ultimately thought desirable.

53. It is evident that the arguments which tell against the permanent adoption of Mr. Probyn's bullion scheme and in favour of a gold currency for India, tell more strongly against Mr. Lindsay's ingenious scheme for what has been termed "an exchange standard." We have been impressed by the evidence of Lord Rothschild, Sir John Lubbock, Sir Samuel Montagu, and others, that any system without a visible gold currency would be looked upon with distrust. In face of this expression of opinion, it is difficult to avoid the conclusion that the adoption of Mr. Lindsay's scheme would check that flow of capital to India upon which her economic future so greatly depends. Moreover, if the system were to be permanent, it would base India's gold standard for all time on a few millions of gold (or rather command over gold) in London, with a liability to pay out gold in London, in exchange for rupees received in India, to an indefinite extent. This was the main reason which weighed with the Government of India in deciding not to adopt the scheme, and we think they were justified in their conclusion. We are not prepared to recommend Mr. Lindsay's scheme, or the analogous schemes proposed by the late Mr. Raphael and by Major Darwin, for adoption as a permanent arrangement; and existing circumstances do not suggest the necessity for adopting any of these schemes as a provisional measure for fixing the sterling exchange.

54. We are in favour of making the British sovereign a legal tender and a current coin in India. We also consider that, at the same time, the Indian Mints should be thrown open to the unrestricted coinage of gold on terms and conditions such as govern the three Australian Branches of the Royal Mint. The result would be that, under identical conditions, the sovereign would be coined and would circulate both at home and in India. Looking forward as we do to the effective establishment in India of a gold standard and currency based on the principles of the free inflow and outflow of gold, we recommend these measures for adoption.

VI.

Convertibility.

55. Under an effective gold standard rupees would be token coins, subsidiary to the sovereign. But existing conditions in India do not warrant the imposition of a limit on the amount for which they should constitute a legal tender; indeed, for some time to come, no such limitation can be contemplated.

56. It is true that in the United Kingdom the silver currency has a fixed limit of 40*s*., beyond which it cannot be used to pay a debt. But this has not always been the case. Prior to 1774 the English Mint was open to silver, and silver coins were an unlimited tender. In 1774 the tender of silver by tale was restricted to 25*l*. in any one payment, although it was left an unlimited tender by weight. In 1798 the free coinage of silver was stopped altogether, the English Mint being thereby closed to silver. In 1816, when gold monometallism was formally established by law, silver coins were placed on a purely subsidiary footing, with a 40*s*. limit of tender. At the present time the right to coin silver is confined to the Government, who are responsible for seeing that there is no over-issue; and in the exercise of that responsibility no additional silver is coined at the Royal Mint for the United Kingdom except in response to the automatic demands of trade, as testified by requisitions received through the Banks of England, of Scotland, or of Ireland. Seeing that for every 20*s*. of additional silver coin requisitioned the Banks have to credit the Royal Mint with a sovereign, there is certainly no temptation to them to demand an over-issue, the immediate profit on which would go not to themselves but to Her Majesty's Government. While it cannot be denied that the 40*s*. limitation tends to emphasise and maintain the subsidiary character of our silver coinage, yet the essential factor in maintaining those tokens at their representative nominal value is not the statutory limit on the amount for which they are a legal tender in any one payment, but the limitation of their total issue. Provided the latter restriction is adequate, there is no essential reason why there need be any limit on the amount for which tokens are a tender by law. It is principally to restriction of the total issue of silver coinage in the United Kingdom that we attribute the fact that 20 silver shillings (intrinsically worth at present about 8*s*. 6*d*.) pass current and are freely received, for all purposes of internal currency,

WESTMINSTER,
LONDON, S.

indifferently with the sovereign which they purport to represent. By law there is no convertibility of our silver coins into gold. They possess an extra-legal convertibility evinced by their being generally and popularly exchangeable into gold, and this quality they owe essentially to the fact that they are not issued by the Government in excess of the volume required for the purpose which they discharge.

57. Outside the United Kingdom there are two principal instances of countries with a gold standard and currency, which admit silver coins to unlimited tender. These countries are France and the United States of America. In France the five-franc piece is an unlimited tender and for all internal purposes is equivalent to gold. The same remark applies in the United States to the silver dollar. At the present time there is no addition to the coinage either of five-franc pieces or of United States silver dollars. In the case of the five-franc piece there was free coinage up to 1874, in January 1874 the coinage was limited, and in November 1878 it was suspended altogether. With the repeal in 1893 of the purchasing clauses of the Sherman Act, the same result was reached with regard to the United States silver dollar. Both in France and in the United States the mints are now closed to the coinage of silver coins of unlimited tender. In neither country are such coins convertible by law into gold; in both countries alike they are equivalent to gold for all internal purposes. For international payments, so far as specie is concerned, France and the United States depend ultimately on the international medium of exchange, which is gold. In the last resort, it is their gold which, acting through the foreign exchanges, maintains the whole mass of their currency at its nominal value for internal purposes.

58. We do not doubt that it is, in theory, possible to attain the same result in India as in France and the United States of America by limitation of the quantity of the rupee currency. The special difficulty in the case of India is one of degree and not of principle. We are unwilling to commit ourselves to the acceptance of the estimates which have been made of the number of rupees actually circulating in India. There can be no doubt but that it is very large; and there are also large quantities of rupees in existence which, though not actually circulating, might, under certain conditions, be brought into circulation. On this account, doubts have been entertained in the past whether the mere closing of the Indian mints to silver would, in practice, be attended with such a restriction of the rupee currency as would make the rupee permanently exchangeable for gold at a fixed rate.

The experience which has been gained since the closing of the Indian mints supports the belief that this result will be attained. From the nature of the case, the demand for rupee currency increases every year; there is no evidence that large quantities of rupees that were formerly hoarded have been thrown into circulation since the mints were closed; the exchange has risen steadily since 1894–95, and the rupee is now actually exchangeable for gold at the rate of 1*s.* 4*d.*; while the demand for additional currency has been so great that over 2,370,000*l.* in gold has been paid to the Indian Treasury for the purchase of silver rupees.

The forces which affect the gold value of the rupee are complicated and obscure in their mode of operation, and we are unable, therefore, to say positively that the mere closing of the mints to silver will, in practice, lead to such a limitation of the rupee currency, relatively to the demands for it, as will make the rupee permanently exchangeable for gold at a fixed rate; but we have no hesitation in repeating the opinion that the experience of the last few years, so far as it goes, indicates that this result is attainable—if, indeed, it has not already been attained.

59. The position of the currency question in India being such as we have explained in the preceding paragraph, we do not consider it necessary to recommend a different policy in the case of that country from that which is found sufficient in France and the United States, by imposing a legal obligation on the Government of India to give gold for rupees, or, in other words, to substitute the former for the latter on the demand of the holders. This obligation would impose on the Government of India a liability to find gold at a moment's notice to an amount which cannot be defined beforehand, and the liability is one which, in our opinion, ought not to be accepted.

Although the Government of India should not, in our opinion, be bound by law to part with its gold in exchange for rupees, or for merely internal purposes, we regard it as the principal use of a gold reserve that it should be freely available for foreign remittances whenever the exchange falls below specie point; and the Government of India should make its gold available for this purpose, when necessary, under such

conditions as the circumstances of the time may render desirable. For example, the Government of India might, if the exchange showed a tendency to fall below specie point, remit to England a portion of the gold which it may hold,—a corresponding reduction being made in the drawings of the Secretary of State; and, when it has accumulated a sufficient gold reserve, and so long as gold is available in its Treasury, it might discharge its obligations in India in gold, instead of in rupees.

60. The exclusive right to coin fresh rupees must remain vested in the Government of India; and, though the existing stock of rupees may suffice for some time, regulations will ultimately be needed for providing such additions to the silver currency as may prove necessary. The Government should continue to give rupees for gold, but fresh rupees should not be coined until the proportion of gold in the currency is found to exceed the requirements of the public. We also recommend that any profit on the coinage of rupees should not be credited to the revenue or held as a portion of the ordinary balance of the Government of India, but should be kept in gold as a special reserve, entirely apart from the Paper Currency reserve and the ordinary Treasury balances.

VII.

The Sterling Rate for the Rupee.

61. We have now to consider the fixed relation which, under a gold standard for India, the rupee should bear to the sovereign. Hitherto we have dealt in general terms with the question of a gold standard, and our recommendations have presupposed a fixed relation, but have not specified the actual rate which should be adopted. We have now to state to your Lordship the conclusions we have reached on this matter.

62. The Government of India proposed in 1892 to close the Indian mints to silver and to pass an Act authorising them to declare gold a legal tender at a rate not exceeding 18*d.* for the rupee. They would not have exercised this power at once, and they would have been guided by circumstances and the experience gained by the closing of the mints in determining what should be the fixed, permanent, legal ratio between the rupee and the sovereign. The rate could not, however, under the law proposed by the Government of India, have exceeded 18*d.* for the rupee, though it might have been lower.

The proposals of the Government of India were generally approved by Lord Herschell's Committee, but the Committee recommended a provisional limit which would prevent the exchange with India from rising materially above 1*s.* 4*d.* for the rupee. The Committee did not recommend that the limit of 1*s.* 4*d.* for the rupee should be the permanent legal ratio between the rupee and the sovereign. It left the question of the permanent legal ratio between the two coins to be decided in the light of subsequent experience. In paragraph 151 of the Committee's Report the following language is used:—

"It would not, of course, be essential to the plan that the ratio should never be fixed "above 1*s.* 4*d.*; circumstances might arise, rendering it proper, and even necessary, "to raise the ratio; and the Indian Government might be empowered to alter it with "the sanction of the Secretary of State. Such a scheme would, indeed, in the first "instance, be tentative, and would not impede further action if circumstances should "render it desirable."

The modifications of the proposals of the Government of India recommended by Lord Herschell's Committee were accepted, the Indian mints were closed to silver, and a provisional arrangement was made for giving rupees in exchange for gold at the rate of 16*d.* for the rupee.

The maximum limit of 18*d.* for the rupee, originally suggested by the Government of India, was not imposed, and the question of the permanent legal ratio can now be considered in the light of what is expedient in the present day, and unfettered by any promises made, or conditions imposed, in the past.

63. In dealing with this question at the present day, it is desirable to have in view an outline of the whole series of facts of exchange, both before and after the closing of the Indian Mints to silver on 26th June 1893. Starting from the year in which

INDIA CORPORATION, LTD.
19, VICTORIA STREET,
WESTMINSTER,
LONDON, S.W.

Germany demonetised silver, the following table shows the average rate per rupee at which Council Bills and Telegraphic Transfers on India were sold in London:

	d.		*d.*
1872–73	22·754	1885–86	18·254
1873–74	22·351	1886–87	17·441
1874–75	22·156	1887–88	16·898
1875–76	21·626	1888–89	16·379
1876–77	20·508	1889–90	16·566
1877–78	20·791	1890–91	18·089
1878–79	19·794	1891–92	16·733
1879–80	19·961	1892–93	14·985
1880–81	19·956	1893–94	14·547
1881–82	19·895	1894–95	13·101
1882–83	19·525	1895–96	13·638
1883–84	19·536	1896–97	14·451
1884–85	19·308	1897–98	15·354

1898–99 - - 15·978*d.*

From these figures it will be observed that, after a fall of about 3*d.* in the first six years, there was comparative stability above 19*d.* for the seven years from 1878–79 to 1884–85; that, apart from the temporary effects of the passing of the Sherman Act in 1890 and the speculation connected therewith, the average rate ranged round $16\frac{1}{2}d.$ in 1887–88, 1888–89, 1889–90, and again in 1891–92; and that, in 1892–93, the average rate had fallen to under 15*d.* It was under these circumstances that, on 31st May 1893, the Herschell Committee, in recommending the closing of the Indian Mints to the public, further recommended that rupees should be coined on tender of gold at the Mints "at a ratio to be fixed in the first instance not much above that now prevailing, say 1*s.* 4*d.* the rupee." They did not propose to go back to the so-called par of 2*s.*; they fixed, provisionally, a maximum limit which was lower by 2*d.* than the limit of 1*s.* 6*d.* proposed by the Government of India. Apart from a momentary rise to 1*s.* $4\frac{1}{32}d.$ for Telegraphic Transfers on 27th June, the Indian Exchange fell steadily away through the second half of 1893 and through the whole of 1894, until on 23rd January 1895 Council Bills were sold at 1*s.* $0\frac{13}{32}d.$ From that date onwards there was, on the whole, a steady and a continuous rise of the exchange, and 16*d.* was regained (after an interval of six years) in the early days of January 1898. From the beginning of 1898 up to the present time, a rate of 16*d.* has practically been maintained without a break, the extreme limits of oscillation for Bills being $15\frac{11}{16}d.$ and $16\frac{1}{8}d.$

64. In the year 1898–99 the total volume of the export trade exceeded that of all past years, amounting to over Rx. 120,000,000 and showed a net surplus over total imports of no less than Rx. 30,000,000. As we have pointed out, this result was achieved with a 16*d.* rate of exchange, and without monetary stringency. We have further pointed out that in the year 1898–99 the Government of India has been able to accumulate a gold reserve of 2,378,609*l.*, which will contribute towards the maintenance of exchange. Moreover, the continuance of existing arrangements, under which no fresh rupees are coined except in exchange for gold at a fixed rate, must tend more and more to establish the exchange at such rate and to ensure the gradual and automatic introduction of a gold currency to supplement, in response to the growing demands of trade, the relatively shrinking stock of rupees.

65. Although the limit of 1*s.* 4*d.* for the rupee was declared to be merely provisional, it has been regarded generally as the permanent rate at which the Indian monetary standard was to be transferred from a silver to a gold basis. There are some who would prefer a lower rate, and there are others who are prepared to accept a higher rate; but it is not desirable, in the absence of any strong reason, to adopt a rate different from that on which calculations have been based, and which has formed the ground of practical action.

We also desire to point out that the rate of 1*s.* 4*d.* is that of the present day; prices in India may be assumed to have adjusted themselves to it, and the adoption of a materially lower rate at the present time would cause a distinct and, in our opinion, a mischievous disturbance of trade and business. The *onus probandi* rests on those who would now propose a different rate. Between the rate of 1*s.* 4*d.* and the rate determined by the bullion value of the rupee, there is no one rate which can be described as natural or normal, rather than any other rate.

66. Various proposals have been made for disturbing the existing rate by the substitution of another rate. It has been proposed to fix the rate at 1*s.* 1½*d.*, 1*s.* 2*d.*, 1*s.* 2$\frac{1}{17}$*d.*, 1*s.* 3*d.*, and 1*s.* 6*d.* All these proposals are arbitrary, and involve a dislocation of the existing ratio between rupee prices and sterling prices. For such disturbance no adequate reasons, in our opinion, have been adduced. In great part these proposals (other than that of 1*s.* 6*d.*) are based on the belief that a lower sterling value of the rupee would cause a rise in rupee prices, benefit the Indian producer, check consumption of foreign goods, and so affect the balance of trade as to promote the importation of gold needed for expanding the volume of currency to an extent commensurate with the rise in the scale of prices.

In our opinion a rise in prices which expresses only the depreciation of the currency is no gain to the community as a whole, and, although the fixing of a lower denomination in sterling for the rupee might for a time give some advantage to producers and induce for a limited period a larger importation of gold than would otherwise take place, this would be at the expense of every holder of a rupee, or debt or security for a fixed amount of rupees; and the taxpayer would again be compelled to provide a larger amount of currency to meet the sterling requirements of the State. It is not by such an expedient as the writing-down of the rupee in sterling that a permanent stimulus can be given to production or to the importation of the standard metal. We see no sufficient reason for altering the existing relations of prices and the essential conditions of contracts expressed in Indian currency, or for reversing the course of exchange and returning to some basis of value which may have prevailed during the interval between the fall and partial recovery in the sterling value of the rupee, and which does not possess elements of permanent stability in a higher degree than the present rate. We are, therefore, of opinion that the permanent rate should be that which has been adopted as the provisional rate in the past, and which is also the market rate of to-day, viz., 1*s.* 4*d.* for the rupee.

67. In recommending a fixed legal rate of 1*s.* 4*d.*, we are not unanimous, though the majority hold the views we have just expressed.

One of our number would not fix the permanent rate at once, but would leave that question to be decided in the light of further experience,—the final rate being fixed either below or above 16*d.*, as further experience might show to be expedient. We are of opinion that any advantage which might arise from this course is more than counterbalanced by the importance of removing doubts as to the future policy of the Government of India, and giving increased confidence to those who are engaged in commercial and financial business in connection with the Indian Empire.

68. Two other Members of the Committee are not prepared to accept the rate of 1*s.* 4*d.*, and recommend that it should be fixed at 1*s.* 3*d.*

It is argued that the rate of 1*s.* 3*d.* will be more favourable to the Indian export trade than 1*s.* 4*d.*; but we have already expressed the opinion that any advantage to the export trade that is gained in this way, is gained at the expense of other members of the community, and is only temporary. If the rate is to be fixed at 1*s.* 3*d.* in order to benefit the Indian exporters and the Indian producer of articles of export, the same argument would justify a further reduction to 1*s.* 2*d.*, and so on, without any limit which we have been able to discover. Nor do we think there are any good grounds for holding that the gold standard cannot be established in India at 1*s.* 4*d.*, while it can be established at 1*s.* 3*d.*

If it is impossible at 1*s.* 4*d.*, it will be impossible at 1*s.* 3*d.*; and we have already dealt in paragraph 66 with the question of the temporary loss and gain to individuals and classes of the community caused by a lowering of the existing rate of exchange. We would add that, if the exchange were now lowered from 1*s.* 4*d.* to 1*s.* 3*d.*, the classes of the community who would gain are those who have already gained through the fall from 2*s.* to 1*s.* 4*d.*, and the classes who would lose are those who have already lost through that fall. Stronger reasons than appear to us to exist would be needed to justify a measure which would have the effect of adding to the gains of the former classes and intensifying the losses of the latter.

It is said that the conditions prevailing in 1893 show that 1*s.* 3*d.* is the rate that should have been adopted at that time. We do not accept this argument, and the conditions have changed since 1893. The rate of 1*s.* 3*d.* may have prevailed shortly before the mints were closed, but the rate of that time was a fluctuating rate. If the mints had been closed some years earlier, and the market rate had been

adopted, the permanent rate would have been considerably higher than 1*s.* 4*d.*; if they had been closed some years later and the same principle had been followed, the permanent rate would have been lower than 1*s.* 3*d.* As we have already said, between the rate of to-day and that determined by the bullion value of the rupee, there is none which can be described as natural or normal; and we can find no good reason for making the permanent rate depend upon the accident of the date on which the Indian mints were closed to silver.

It is true that Lord Herschell's Committee remarked that "to close the mints for "the purpose of raising the value of the rupee is open to much more serious objection "than to do so for the purpose of preventing a further fall;" but an undue stress is laid on these words when they are used as an argument against permanently adopting a rate of 1*s.* 4*d.*, since that Committee actually adopted a provisional rate of 1*s.* 4*d.* and expressly said that circumstances might arise rendering it proper, and even necessary, to raise the rate.

69. We recommend that there should be no change in the existing relation of the rupee to the sovereign. The experience gained since the mints were closed in 1893, and particularly that of the last eighteen months, appears to us to justify the anticipation that the existing rate of 1*s.* 4*d.*, will, with possible temporary fluctuations, due to the course of trade, be maintained in the future.

VIII.

70. In conclusion, we desire to record our opinion that the effective establishment of a gold standard is of paramount importance to the material interests of India. Not only will stability of exchange with the great commercial countries of the world tend to promote her existing trade, but also there is every reason to anticipate that, with the growth of confidence in a stable exchange, capital will be encouraged to flow freely into India for the further development of her great natural resources. For the speedy attainment of this object, it is eminently desirable that the Government of India, with whom it will rest to decide when successive steps should be taken, should husband the resources at their command, exercise a resolute economy, and restrict the growth of their gold obligations.

71. We desire to express our high appreciation of the assistance which Mr. Chalmers has rendered to us throughout the whole course of this inquiry. We feel it to be our duty to recognise in the strongest terms the knowledge, ability, courtesy, and industry which he has displayed and which have greatly facilitated our labours.

Secretary.

* Subject to a reservation as to the ratio to be adopted between gold and the rupee and the points connected with that question in regard to which our views are expressed in the subjoined Note.

Although I am aware that the question of the banking facilities of India was not referred to the Committee, I venture to call special attention to the first part of paragraph 22 where it is pointed out that they have not of late years kept pace with the increasing trade, and, further, to draw attention to the fact that it has been considered wise in Europe to entrust the carrying out of currency laws to banks established or strengthened for that purpose. In my opinion, a strong bank, properly constituted, would be a powerful assistant in giving effect to any regulation having the convertibility of the rupee in view, and that, working under prop currency regulations, such a bank would be likely to carry them out in a m effective way, and in a manner more in harmony with the trade wants of t country, than any Government Department, however well administered, could possibly do.

I venture to call attention to this point because I believe that the success of the recommendations of the Committee, if adopted, will very much depend on the banking wants of the country being assisted in times of pressure, and curtailed in times of slackness; and this, in my opinion, could only be done by the establishment of some institution having ample facilities at its disposal, and framed on somewhat similar lines to those of either the Bank of England or the Bank of France.

E. A. HAMBRO.

Since the Committee was appointed, the condition of the money market in India has so greatly improved that the immediate settlement of the currency question has, in my opinion, become less urgent than it was in the spring of 1898.

Under existing conditions, gold is not—in form—a legal tender in India; yet, for all practical purposes, the sovereign is now a legal tender for 15 rupees, because the holder of a sovereign can obtain for it 15 rupees at the Government Treasury, and these 15 rupees constitute a legal tender. To make the sovereign a legal tender at the rate of 15 rupees, is therefore only a change in form and not in substance, and will neither strengthen exchange, nor be likely to lead to a greater import of gold into India.

It may be that further experience will show the balance of advantage to lie with a lower exchange than 1*s.* 4*d.*; or, on the contrary, circumstances might conceivably arise (*e.g.*, silver legislation in the United States) which would necessitate a higher rate. In view of these possibilities, and of the fact that the existing monetary conditions of India are not, in my judgment, producing any serious evils, I am of opinion that no action should be taken at the present time, in the direction of finally settling the rate between the sovereign and the rupee; but that the question should be left to be decided in the fuller light which would be afforded by further experience.

Subject to these remarks, I am in general accord with the principles of the Report.

W. H. HOLLAND.

We do not admit that the experience of the last six years justifies the adoption of a 1*s.* 4*d.* ratio. For five years after the closing of the mints exchange never effectively reached that level in the sense of bringing gold to the currency; and, while giving due weight to the fact that during the last six months the Currency Department has received a considerable amount of gold, we cannot agree that a single year of unprecedentedly large exports, arising from exceptional causes, is a sufficient basis for assuming that this will continue to the extent necessary for India's currency requirements. The great rise in the price of wheat in April/June of last year increased the Indian exports of that article to Rx. 9,720,333, as compared with Rx. 1,341,151 in 1897–98 and an average of Rx. 2,750,137 in the five years 1893–94 to 1897–98 inclusive. The exports of rice were also Rx. 3,500,000 above the average of the previous five years. But for these exceptional causes, last year's total exports would not have been unusually large, and it may be questioned whether gold would have found its way to India as currency in any quantity.

A review of the circumstances which accompanied the closing of the mints, is sufficient to show that the violent disturbances which unsettled exchange for several years, were mainly due to the arbitrary enhancement of the rupee to 1*s.* 4*d.* On 31st

INDIA CORPORATION, LT
19, VICTORIA STREET,
WESTMINSTER,
LONDON,

May 1893, the date of the Herschell Committee's Report, exchange stood at 1*s.* 2$\frac{5}{16}$*d.* It will be remembered that although the Report was not made public till the 26th June, the day the mints were closed, its purport became known to a group of speculators almost as soon as it was signed (a correct summary was published in a continental newspaper on the 7th June). This led to immense speculation in exchange and rupee paper, in connection with which unusually large remittances were made to India. Between the 31st May and the 6th June no less than Rx. 3,780,000 Council bills were sold and in addition 1,180,000*l.* of bar silver was shipped. It was then believed that the closing of the mints would establish a 1*s.* 4*d.* rate, and consequently there was a strong movement to remit money out at anything under it. Exchange touched 1*s.* 4*d.* for a day on the 27th June, but it soon became apparent that the rise had been overdone, and the downward movement which followed, assisted by the plethora of money arising from the above operations, carried exchange as much below its level as it had previously been forced above it. Had a 1*s.* 3*d.* rate been adopted, these wide fluctuations would not have taken place; and we believe the market would have settled down to it without much difficulty, that gold would have gone to India as currency to a fair extent in 1896-97 if not earlier, and to a larger extent in 1897–98, and that the intense monetary stringency of these two seasons would have been avoided.

When exchange began to advance after touching its lowest point on the 23rd January, 1895, it gradually recovered without any pressure on the money market till 1*s.* 3*d.* was reached in November 1896. The Presidency Banks' rates were then 6 to 8 per cent., the latter being the highest rate touched during the period in question. It was only when exchange began to rise above 1*s.* 3*d.* that stringency was experienced; and that the raising of the rate by the additional penny required to bring relief in the shape of gold, became a difficult process accompanied by extreme monetary pressure.

These considerations appear to us to point to 1*s.* 3*d.* as the ratio which should be adopted rather than a forced ratio of 1*s.* 4*d.*

The advocates of a 1*s.* 4*d.* ratio point to the fact that this rate has now been, more or less, effective for the last 18 months, thereby establishing a *status quo* which it would be unwise to disturb. This argument would have greater weight if the *status quo* had been arrived at in a natural way; but the circumstances under which it was reached have only to be considered to deprive it of any value. With no fresh currency otherwise obtainable, the monopoly rupee was bound in time to rise to whatever gold point the Indian Government chose to fix, and the fact of its having risen in five years to 1*s.* 4*d.* is of itself no more a proof that 1*s.* 4*d.* is an equitable ratio than it would be in regard to 1*s.* 6*d.* or 1*s.* 8*d.*, which could equally be reached in course of time. To arrive at a rate in this manner and then point to the accomplished fact as disposing of any question of its propriety is not convincing, especially if there is reason to believe that a rupee so greatly enhanced is calculated to have an injurious effect on the country's interests and to retard or even jeopardise the success of the gold standard.

We approve of the principle that India should be allowed to acquire the necessary gold by means of the trade balance in her favour. But to enable her to do so, anything calculated to injure that balance should be avoided. This is equally imperative on the ground that it is on the trade balance that India also depends for the power to meet her foreign obligations; and the rate of exchange, or the ratio fixed between gold and the rupee, is of the greatest importance in its bearing on her ability to maintain a balance of exports over imports, sufficient to meet both these requirements.

The Committee have obtained a great deal of evidence as to the effect of exchange on trade, and, although opinions differ, this at least is undoubted, that the rate of exchange has a direct influence on the rupee prices of articles of export and import. A lower exchange gives the Indian exporter a higher rupee price for his produce, without raising the gold price to the foreign buyer, while compelling an importer of foreign goods to exact a higher rupee price to cover his gold outlay. A higher exchange on the other hand lowers the rupee price of native produce, while enabling the foreign importer to sell his goods cheaper. An appreciated exchange through its action on prices has thus a double effect on the trade balance, by checking exports and stimulating imports. And that this is not of the temporary character which some maintain is shown in India's opium trade with China.

Owing to the closing of the mints, China exchange on India has fallen from about 306 rupees per 100 taels in 1892–3 to the present level of about 204 rupees, it has been

even lower; thus necessitating a higher price for opium in China to give the Indian exporter the same rupee return. Viewed in this light, the course of the trade is instructive.

There has been an advance in the tael price in Shanghai from an average (Patna, Benares, and Malwa together) of about 397 taels per picul in 1892 to 556 taels in 1897, notwithstanding which the price in India has fallen from an average of about Rs. 1,202 per chest in the former year to about Rs. 1,114 in the latter, while Indian exports have diminished from 75,384 chests in 1892–3 to 56,069 chests in 1897–98.* We thus see the effect of the enhanced rupee in a falling off in the Indian exports and a lower rupee price, —the rise in the tael price, large as it is, not having gone far enough (being checked by the stimulus given to Chinese native competition) to enable India to export to the same advantage in face of the adverse exchange. Looked at from China's point of view, the effect of the fall in the tael exchange in checking imports into China is equally apparent, and the truth of the principle that a rise in exchange checks exports and stimulates imports, while a fall has the contrary effect, is thus shown in the trade of both countries. In the Budget Statement of March 1899, paragraph 166, the Finance Minister makes the following comment in his remarks on opium:—"The growing "competition of the China drug has prevented the price in China from rising in "proportion to the increased value of the rupee due to the currency legislation of "1893." For "increased value of the rupee" read "fall in the China exchange on India," and there could not be a clearer confirmation of the effect of the enhancement of the rupee on India's opium trade. It must be added that the export of opium to China increased last year to 67,128 chests, which is explained in the same paragraph to be "largely due to a scanty crop in China."

* These figures are taken from the "Financial and Commercial Statistics," up to the end of 1897, published by the Government of India. The volume embracing 1898 is not yet issued.

The opium trade has been described as a dwindling trade at the best, but it is impossible to doubt that the falling off in the last six years is largely due to the enhanced rupee.

Another branch of India's trade with the Far East—her exports of cotton, cotton yarn, and goods—is also exposed to a danger which it would be unwise to aggravate by pushing the enhancement of the rupee too far. Within the last few years an important cotton mill industry has sprung up in China and Japan for the supply of their home markets, although the effect on India has scarcely yet had time to manifest itself for two reasons,—first, that Japan uses Indian cotton largely in her mills, which, so far, places her products on a level with those of India,* and, secondly, because the China mills only came into operation in the end of 1896 (Q. 12, 493), so that the industry is still in its infancy. The conditions, however, which have assisted the competition of China-grown against Indian opium may in time be equally effective in regard to cotton. There are indications that the cultivation of cotton is extending (Consular Report, p. 57, Vol. II.), and, if Japan should find it more advantageous to buy her cotton in China, a serious blow may in time be dealt to another branch of India's export trade.

* Although Japan is on a gold basis, it is at a ratio equivalent to 11¼*d.* per rupee as compared with India's 1*s.* 4*d.*

We do not ignore the evidence as to the appreciation of copper cash, which as the usual wage-paying medium in China must largely govern the cost of production. We are told (Q. 8,250–2) that it has appreciated in relation to silver about 15 per cent. in the last five or six years. This represents less than half the fall in the China exchange, so that a modification of the present enhancement of the rupee is still necessary to put India on fair terms of competition with China.

India's disadvantage is not less real in her competition with silver standard countries for the export trade to neutral markets. As regards tea, China with her dollar at its bullion value will be greatly assisted by an enhanced rupee in her endeavours to recover her former predominant position. Although her exports of tea to the United Kingdom are now comparatively small, her total exports amounted to 205,000,000 lbs. last year. Her productive power is, therefore, by no means crippled, and it would be a mistake to think that India can afford to disregard her competition.

In principle, the effect of an enhanced rupee equally applies to India's trade with gold standard countries, although as sterling exchange has never fallen to the silver bullion point it may be less marked.

Without going so low as that point or even the lowest rate touched since 1893, the arbitrary enhancement of the rupee has been considerable, and the step taken last year went a good deal beyond merely checking a further fall. Referring to the [illegible] of

INDIA CORPORATION, LTD.
19, VICTORIA STREET,
LONDON, S.W.

the Herschell Committee, we find that, after discussing at some length the probable effect on Indian trade of a rupee divorced from its bullion value, they arrive at the following important statement in paragraph 135:—"It is impossible, in view of these "considerations, not to come to the conclusion that to close the mints for the purpose "of raising the value of the rupee is open to much more serious objections than to do "so for the purpose of preventing a further fall." The value of the rupee on the 31st May 1893, the date of the Committee's Report, was 1*s.* 2$\frac{5}{8}$*d.*, and it is difficult to reconcile the above declaration with their conclusion recommending a ratio of 1*s.* 4*d.*, or more than 9 per cent higher. Even applying the expression "preventing a further fall" to the date of their appointment, the 21st October 1892, the rate of exchange then was 1*s.* 3·06*d.*, on which 1*s.* 4*d.* represents an enhancement of 6 per cent.

As to the compensating adjustments which are said to make up to the producer for the smaller rupee price he has to accept for his produce in consequence of a higher exchange, we are unable to see where they are to come from—they have not yet been arrived at in the case of opium. The evidence shows (Q. 9612–6) that wages in India, that is cost of production, have not fallen since the rupee was at 12$\frac{1}{2}$*d.* four-and-a-half years ago, nor does it appear that any fall is likely, even if such a thing were desirable, so that there is no compensation to be looked for in that direction, nor do we think it can be expected from a rise in the sterling prices of those articles in which India competes with other countries. Indian wheat, for instance, has to compete in the European markets with the wheat of Europe, the United States, Canada, Argentina, &c., and forming but a small proportion of the total supply can have an equally small influence in determining movements in the price. If a rise in the sterling exchange renders it necessary that India should get a higher price for wheat in England to give her the same rupee return, is it likely that the holding back for a higher price of a few thousand tons of Indian wheat will have any appreciable effect in that direction while the home supplies and the imports from these other countries are pouring in as usual? Any attempt to establish a rise for India's benefit would at once be swamped by increased supplies from other quarters. The market will not concern itself with the larger or smaller rupee out-turn realised by the Indian grower, who will either have to take the current price or do without; and the lower rupee price caused by the higher exchange must therefore represent a loss to the producer.

It is on this aspect of the question that we base our strongest objection to the 1*s.* 4*d.* ratio,—its effect as an unfair tax on native production while conferring a bounty on imported goods. It is not a sufficient reply to this to say that, as imports are paid for by exports, the gain and loss to the community are equal. This is evident when we consider that the native producer is the class which loses, while the class which gains is the consumer of imported goods. It can never be sound policy to handicap native industry while giving a bounty to foreign imports, and in the case of India with large foreign obligations, which can only be met by surplus exports of produce, it would be a fatal course to pursue. But beyond the effect on exports and imports so far as they balance each other, it still remains that with a 1*s.* 4*d.* exchange the cost of providing at Rs. 15 each the 17 million sovereigns annually required for the home charges is a tax which falls entirely on the producer. The more the rupee is enhanced—the lower the sovereign is valued in rupees—the more cheaply can the Government make its annual remittances. But this advantage is not obtained without being paid for, and the question who pays is not difficult to answer;—it is the producer, who has to accept so many fewer rupees for the produce he has to sell. If with a 1*s.* 4*d.* exchange the holder of a sovereign can only get Rs. 15 for it, he cannot afford to pay so many rupees for a ton of Indian produce as if with exchange at 1*s.* 3*d.* he could convert his sovereign into Rs. 16. To deny that arbitrary enhancement of the currency is a tax, and to argue that the producer is no worse off in the long run, that wages and other charges must in time adjust themselves to its altered value, is to maintain the dangerous principle that the Government may lighten its liabilities without injury to anybody by a step of this kind. Such a step is undoubtedly a tax on production, and if the Government plead that in the absence of any other available source of revenue trade must bear it, it is unwise to throw the whole of it on one side of trade, the side which it is least expedient to tax, and to penalise production while giving a bounty to foreign imports. The present duty on imports does not counterbalance the bounty conferred by a 1*s.* 4*d.* exchange, and the burden would be more equitably adjusted by reducing the ratio to 1*s.* 3*d.* In addition to its beneficial effect on trade this would relieve production by about 6$\frac{1}{4}$ per cent., while depriving foreign competition of a corresponding bounty, and last year's favourable Budget gives ground for the hope

that the additional cost to the Government would be made good out of existing sources of revenue.

The ratio is still an open question. In his speech introducing the Act of 1893, Sir David Barbour stated that it was left open to be decided by the light of future experience. The Government, therefore, are not committed to 1*s.* 4*d.*, they are perfectly free to alter the ratio now without exposing themselves to any charge of weakness or breach of faith. The desirability of adhering to existing conditions should not be allowed to weigh at the present stage. Whatever objections there may be to altering the ratio now, they are trifling in comparison with what will be experienced later, should the present ratio not be found practicable. To amend the ratio now would only be to act on the reservation made in 1893, to do so later, after having formally adopted 1*s.* 4*d.* would be a much more serious matter.

The test of a proper ratio is not merely that it should enable the Council Bills to be absorbed, or even its power to attract gold in an exceptionally prosperous year. It should be such as to do so in normal times sufficiently to provide for any drain occasioned by an exceptional adverse season, and to allow gold to gradually accumulate and supplement silver in the currency. To aim at a ratio which would fail to accomplish this for the sake of getting a high price for the Council Bills, would be to starve the currency, injure trade, and invite an ultimate breakdown. As India is debarred from obtaining any fresh silver currency, no difficulty should be placed in the way of her requirements being satisfied by gold. The ratio adopted should, therefore, be one which will encourage the free inflow of gold rather than one which, even if it might attract some gold in a year of unusually large exports, would fail to do so in ordinary times. In the one case Indian trade would have the advantage of a full supply of currency and easy rates of interest; in the other it would be continually harassed by monetary stringency and by a lame and inefficient currency system which would, sooner or later, prove a failure.

The success or otherwise of the gold standard will largely depend on the rupee value put upon the sovereign. The higher the rupee is raised above its bullion value, the more difficult will the establishment of the gold standard become. On the value put upon the sovereign will depend not only the extent to which gold is brought into the currency, but also how far it will be allowed to remain in circulation, or will disappear, driven out by the over-valued rupee. It is significant that, of the immense amount of gold held in India, practically none has been tendered to the Currency Department, even during periods of extreme monetary pressure. What has been acquired has, with a trifling exception, been imported gold.* This is not reassuring as to the result when gold is made legal tender and a sovereign and Rs. 15 are supposed to be mutually interchangeable. India is a large consumer of gold, and to undervalue it in relation to the rupee will have the effect, not only of discouraging its tender to the Mint, but of encouraging the market to supply itself by withdrawals from the currency. The successful establishment of a gold standard will not be promoted by insisting on getting gold too cheap.

* Of Rx. 3,430,000 received by the Currency Department up to 19th June last, only Rx. 42,500 in Bombay and a trifling amount in Calcutta came from gold held in India; the balance was all imported.

Going back to 1893, the conditions then prevailing clearly pointed to 1*s.* 3*d.* as the ratio which should have been adopted then; and we can see nothing in subsequent experience to justify the belief that 1*s.* 4*d.* is the more suitable ratio now. On the contrary, we consider 1*s.* 4*d.* an extreme ratio, which imposes too severe a tax on production, and is calculated to injure the trade balance necessary for India's solvency, and that the corresponding ratio, of Rs. 15 per sovereign, by putting too low a value on gold, will tend to prevent its going into or remaining in circulation, and thereby endanger the success of the gold standard.

We believe 1*s.* 3*d.*, or Rs. 16 for a sovereign, to be a ratio which would not be injurious to India's interests, and under which she would be able to acquire by trade influences the gold necessary to make the gold standard effective. We therefore recommend that the ratio should be altered from 1*s.* 4*d.* to 1*s.* 3*d.*, or to Rs. 16 per sovereign, instead of Rs. 15.

In making this recommendation, we cannot be regarded as advocating a depreciated currency, in the true sense of the phrase. We are a long way from the point at which the term depreciation would be appropriate;—the rupee at 1*s.* 4*d.* is, on the contrary, immensely appreciated, and in urging a change to 1*s.* 3*d.* we are only seeking to correct what we consider to be an excessive, arbitrary enhancement.

ROBT. CAMPBELL.
JOHN MUIR.

INDIA OFFICE
19, VICTORIA STREET,
WESTMINSTER
LONDON.

Sterling borrowing in order to acquire gold is so prominent a feature of the Government of India's proposals and of other schemes which have been put before the Committee, that we consider it desirable that the principle of borrowing for such a purpose should be thoroughly examined.

Sterling borrowing is in itself objectionable on the ground that it aggravates the exchange difficulty by permanently increasing the home charges, but there are special reasons besides against borrowing for the purpose of establishing and maintaining a gold standard. If India is unable to acquire gold except by borrowing, that alone would go far to prove her unfitness for a gold standard and her inability to retain gold so acquired. Gold attracted to the currency by trade influences might reasonably be expected to remain in circulation, but there could be no certainty that gold brought in by borrowing would do so; the presumption would be rather the other way, because, short of withdrawing rupees to make room for it (a proposal which has been universally condemned), it is difficult to see how borrowed gold could be introduced into the circulation without creating monetary conditions which would drive it back to England again.

If, however, as we believe, India is able to obtain the necessary gold by means of the trade balance in her favour in the same way as she formerly obtained her silver currency, why should the expensive and objectionable method of borrowing be resorted to? The only advantage of borrowing would be to hasten convertibility, an advantage which would be gained at the expense of any assurance of ultimate success, or any certainty that the borrowed gold would not begin to disappear as soon as convertibility was attempted, while the disturbing influence on the Indian money markets of bringing in large amounts of borrowed gold would not be wholesome. A measure on the other hand under which gold would flow to India gradually as trade and currency requirements dictated, even if it took several years to introduce into the circulation sufficient to make the standard fully effective, would carry with it a confidence which could never be inspired by the sight of gold forced in by artificial means, while the automatic supply of currency as from time to time required would keep the money markets from either undue plethora or stringency.

Italy furnishes a practical illustration of the result of attempting to establish a gold standard by means of borrowed gold. The Italian Government obtained by sterling loans a large amount of gold for that purpose, but they have not succeeded in their endeavour. They dare not allow the gold they borrowed to go into circulation, because it would at once be exported. At the present rate of Italian exchange the gold, if obtainable, would give a profit of 6 to 7 per cent. to send abroad, and, with the foreign exchange so much above the gold point, the gold standard has disappeared.

A further objection to forcing gold into the currency by borrowing, is the effect it would have in obscuring the proper ratio between gold and the rupee, the ratio at which a gold currency would be practicable, and the mischievous effect it might have in enforcing for the time a ratio which without the continued support of borrowed gold might prove to be unworkable and would therefore ultimately break down. With 120 crores of rupees in circulation, which must continue to be unlimited legal tender for years to come, the change from a silver to a gold standard is not the simple question of raising so much gold and putting it into circulation at any arbitrary ratio to the rupee which may be chosen. The lower gold is valued in relation to the rupee, the greater will be the difficulty of keeping it in circulation and the greater the danger of the under-valued gold disappearing, leaving the sterling debt as the only lasting result of the operation. A gold standard and currency can only be established and maintained on conditions which will permit of gold flowing freely to India in obedience to trade requirements, and any measure which attempts to override these conditions and force gold in by artificial means will break down sooner or later.

For these reasons we are opposed to sterling borrowing, whether for the establishment or the maintenance of a gold standard. Borrowing to support the standard once resorted to, it would be impossible to know when to stop, and the only safe course is not to begin. It is on trade support that the maintenance of the gold standard must in the long run depend, and any saving of delay through borrowing would not be worth the risk of finding, after having incurred a load of sterling debt with its consequent addition to the home charges, that an impracticable scheme had been pursued which when left to its own merits would break down.
